STEEL, the metalworking weekly, is selectively distributed without charge to qualified management personnel with administrative, production, engineering, or purchasing functions in U. S. metalworking plants employing 20 or more. Those unable to qualify, or those wishing home delivered copies, may purchase copies at these rates; U. S. and possessions and Canada, \$10 a year; all other countries, \$20 a year; single copies, 50 cents. Metalworking Yearbook issue, \$2. Published every Monday and copyright 1959 by The Penton Publishing Co., Penton Bldg., Cleveland 13, Ohio. Accepted as controlled circulation publication at Cleveland, Ohio.

Index available semiannually. STEEL is also indexed by Engineering Index, 29 W. 39th St., New York 18, N. Y.

YODER

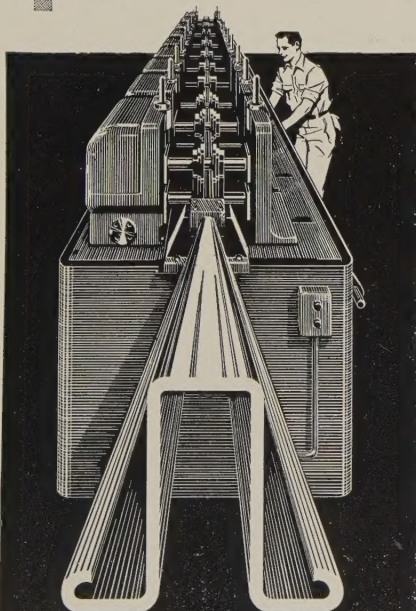

Roll Forming Equipment

—Product dependability—integrity of manufacture—engineering for specific production needs have all contributed to establish Yoder equipment as the industry standard of excellence. Since 1909 Yoder-built machinery, including Pipe and Tube Mills, Roll Forming Equipment and Rotary Slitters, have earned world-wide customer satisfaction and recognition.

Profit from Yoder's years of engineering and service experience. Send today for the illustrated Yoder Roll Forming Equipment Book.

behind the scenes

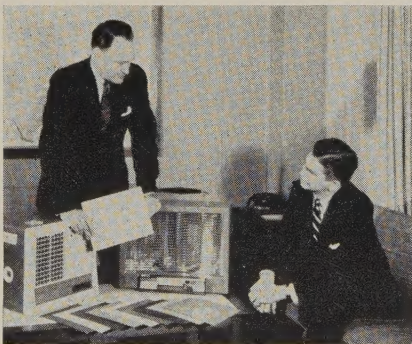

New Material Born

STEEL's Pittsburgh editor, Bill Wallace, hurried through a cold, wet, January dawn to keep an appointment with Richard P. Lord, director of product development, United States Steel Corp. Additional journeys and interviews would take him from Pittsburgh, to New York, to Cleveland—always in inclement weather (mostly on account of what else can we expect in winter?), but he didn't mind too much because he was on the track of an important story.

On the first time around he approached Mr. Lord, shook himself like a Labrador retriever, and remarked that it was raining. Good reporters are like that; they don't miss anything. Nor did Bill miss any points of the remarkable story Mr. Lord outlined for him, a story which you may read beginning on Page 73. Basically, the United States Steel Corp. has created a new product, a combination of steel and plastic. It has color, feels like leather, has the strength of steel, and may be bent, rolled, deep drawn, welded, and—well, consult the article for technical details.

Mr. Lord explained that the USS cures and bonds liquid plastisols to steel in a continuous mill coating process, in gages from 18 to 28, in widths up to 52 in. The resulting steel sheets and coils can then be embossed with any texture that can be engraved on a printing roll. The material is available to industry in almost

any shade or color. Mr. Lord (left) is saying all this to Bill in the illustration included herewith.

Because color means so much to the story, the editors went whole hog, and splashed with a set of four-color lithographic reproductions. Let it be explained that the casual use of four-color reproduction in an average business paper editorial presentation is not as common as one might suppose. USS supplied the color transparencies, Art Director Bill Kellogg supervised the layout, Crane-Howard Lithograph Co., Cleveland, reproduced it, and Associate Managing Editor Vance Bell—

who could scarcely wait to read proofs—declared that it was about the most exciting article STEEL had published in a right smart spell.

Vinyl coated steel is amazing stuff. USS boiled it two days, then deliberately tried to set it afire, only to learn to its great astonishment (and satisfaction!) that it stood up continuously under 160° F, softened slightly at 350° F, and charred at 400° F. A man armed with a blowtorch couldn't set it afire because all tests indicated that it would not support combustion.

The embossed textures and bright colors are definite marketing points for the product; it is sold on its warmth and feel, as well as its strength.

Persian Interlude

An item in the *Edgar Allen News*, house organ of the Edgar Allen & Co. Ltd., Imperial Steel Works, Sheffield, England, reveals the death of a sheep in Doroud, Iran. Doroud is down the road a piece from Khorramshah. The Edgar Allen people erected a large cement manufacturing plant in Doroud, an event that didn't go unnoted by the pious Persians. They celebrated the erection by killing a sheep, an event that didn't go unnoted by an Edgar Allen director, W. J. McBride, who was visiting the plant site at the time. Mr. McBride made some photographs to exhibit to his fellow directors. Bloody handprints appeared on the kiln because, after the sacrifice, everybody went back to work, and you can't expect honest workmen to wash their hands every 5 minutes.

Did the following scene take place later in the Sheffield office? An officious clerk, studying the photographs at McBride's invitation, looks up suddenly. "Excuse me, sir, but did you notice the great muddy 'andprints on our nice new kiln, sir?"

McBride: "Not at all, Hawkins; not mud; BLOOD!"

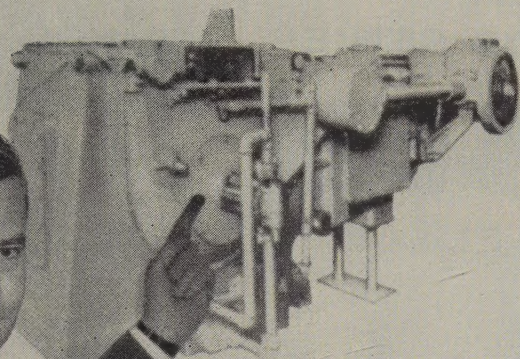

New Deals

The professor was dealing five card stud, and one of the players was complaining that he always got the same old cruddy hands. "Practically impossible," said the professor. "From an ordinary pack of 52 cards, I can deal . . . different combinations of five cards each, so the likelihood of duplicate hands is remote."

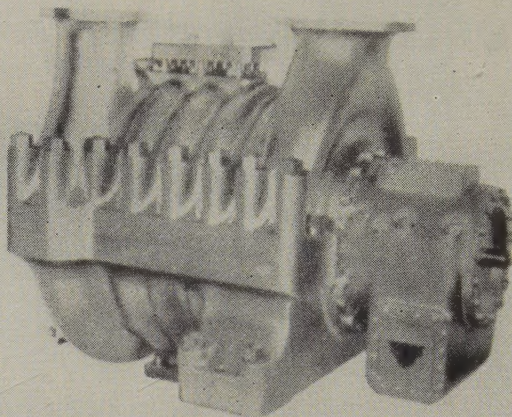

Can you fill in the blank?

George Edick, Sales Manager Domestic Division, The Cooper-Bessemer Corporation, displays three types of units for oxygen production and explains...

How Cooper-Bessemer can help you plan oxygen facilities to improve steel-making

It will pay you to check Cooper-Bessemer when you start to plan oxygen facilities for steel production because:

Unbiased analysis. Since we offer all types and sizes of compressors and expansion engines, we can apply the units best suited to your specific needs.

Integrated installation. We can provide complete engineering service for the entire power-compression-expansion operation, including En-Tronic controls for most economical operation.

Unmatched service. Our outstanding field service and warehouse facilities nearby assure prompt attention to your operating needs... at start-up time and for the years to come.

STEEL Points Up Trends

I find STEEL useful for keeping up with industry trends, and I am well aware of its prestige with people in our industry. That's why I hasten to point out a mis-

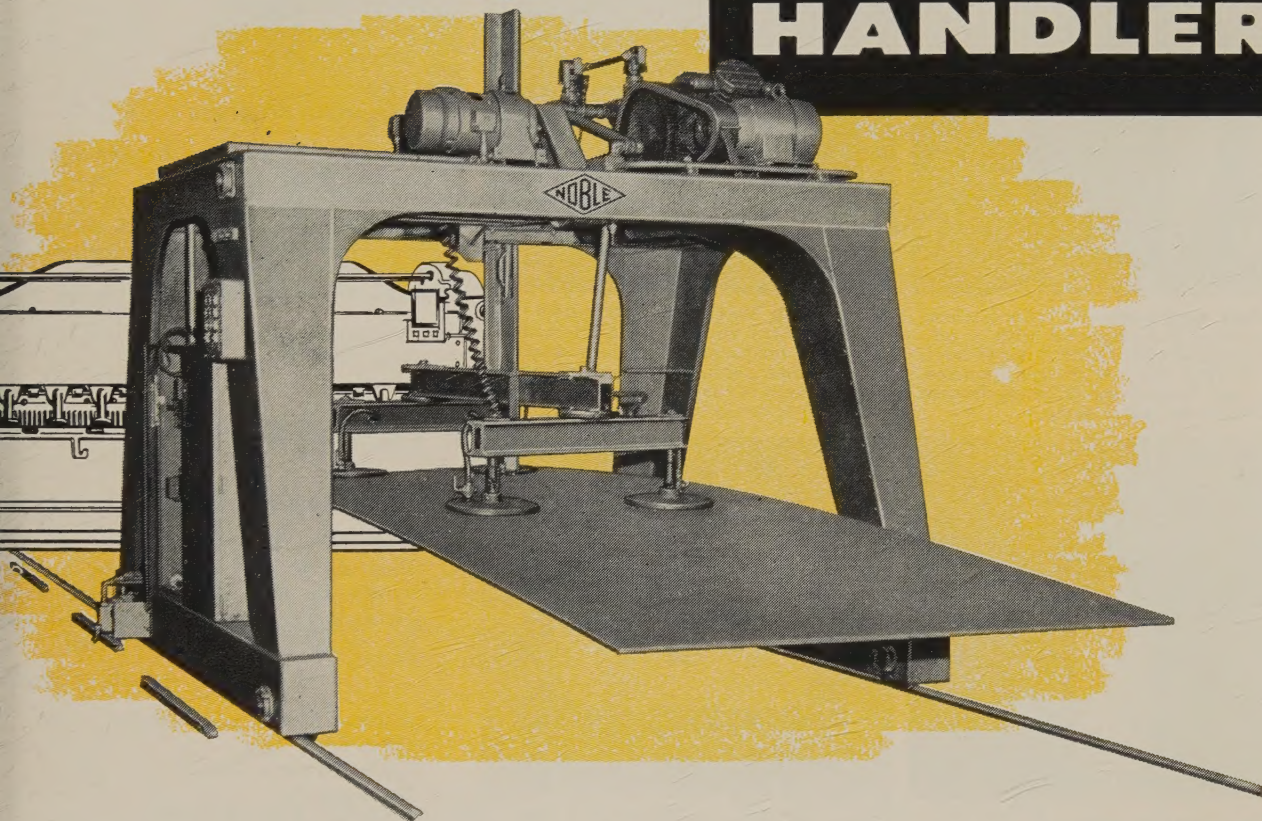

(Please turn to Page 12)

How to Make Your Shear a Production Tool

-ADD A

Automatic
**PLATE
HANDLER**

Faster Plate Handling at Lower Cost

The NOBLE Automatic Plate Handler eliminates the 3 slow, costly and often dangerous manual operations sketched at left. The usual 2- or 3-man crew needed to pry up the plate, attach lifting hooks, operate the crane or hoist and move the plate into position is eliminated. At a touch of the control button, your NOBLE Automatic travels to the stack, picks up a plate, raises it to proper height, brings it right to the ball points or casters and puts it into position for shearing, punching, or whatever operation is required. Machine operators and their helpers spend their time on production, not manhandling plate!

LESS IDLE MACHINE TIME...

With a NOBLE Automatic on the job, there's always a plate ready at the machine — no idle standby while operators help wrestle another one off the pile and onto the feed table. You get maximum earning power out of your machine investment.

INCREASED PRODUCTION...

The natural result of reduced idle machine time and faster plate handling. NOBLE Automatic Plate Handler users report a gain of 20% or more, depending on type of application.

THREE TYPES AVAILABLE...

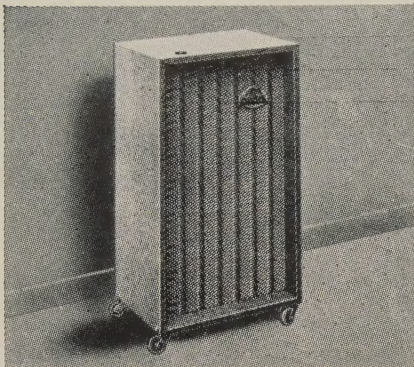

Standard NOBLE automatic plate handling systems are available in floor-mounted rail, overhead rail and radial transfer types. Standard capacities are 1,000, 2,000, 3,000 and 4,000 lbs.

NEW BROCHURE AVAILABLE... describes economies of automatic plate handling, proper applications, typical system layouts, and all NOBLE equipment involved. Write for your free copy today; please address Dept. S-3.

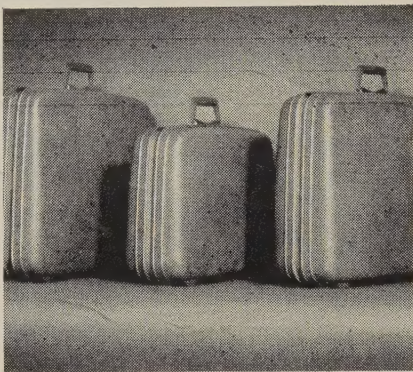

1860 Seventh Street
Oakland 20, California

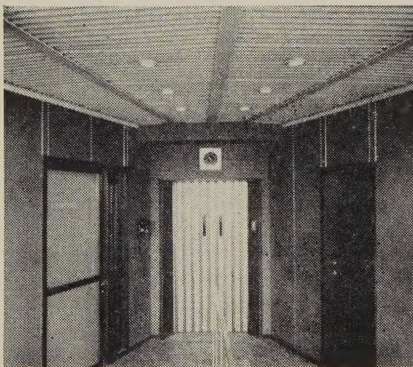

Which of these PRODUCT IMPROVEMENTS can step up your sales?

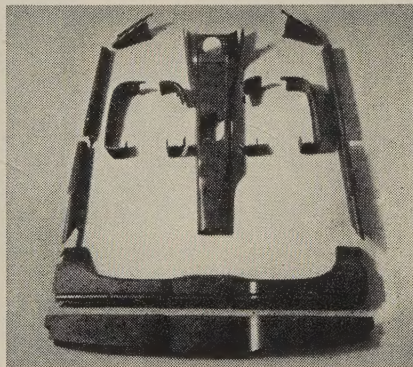

Smarter appearance? Ebco's Oasis dehumidifier is high-styled with a cabinet of tweed-finish COLOVIN vinyl laminated to steel. Case is pierced, notched, drawn and formed on same equipment that is used for metal alone.

Strength without weight? By using COLOVIN vinyl laminate, Samsonite creates a spectacularly modern shape in luggage that combines the weightlessness and strength of magnesium with the look and feel of top-grain leather.

Indestructible finish? At the Brussels Fair this handsome Atomium corridor featured bulkheads of linen-finish COLOVIN vinyl laminated to steel. Despite the abuse of heavy traffic, both color and finish remained fresh.

Ease of machining? All these parts of the Thunderbird interior are formed from leather-finish COLOVIN vinyl-on-steel. The laminate is machined on standard equipment, requires no painting, finishing, or costly hand operations.

Get them all with this new material!

Colovin vinyl permanently bonded to steel, aluminum, magnesium or wood offers unlimited possibilities for restyling painted products with the authentic look and feel of fine fabrics or leathers. In production it can be machined and formed on standard equipment as precisely as metal alone, is even more damage-proof, and

requires no painting, finishing or costly hand operations.

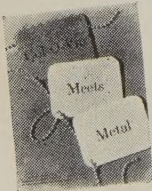

Get the whole story in "COLOVIN Meets Metal." Laminate samples, colors and textures, test specifications, industrial applications, and list of laminators to whom we supply COLOVIN vinyl sheeting. Mail coupon.

Hoopston, Ill.

Metalworking Outlook

March 9, 1959

Economist Predicts Steel Wage Settlement at 8 Cents

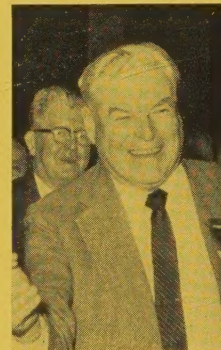

Steelworkers are likely to settle for a basic wage increase of about 8 cents an hour this year, strike or no. That's the opinion of Princeton University's Prof. Richard A. Lester. He reasons that in an upswing year, Dave McDonald will feel compelled to go after more than Walter Reuther's autoworkers got in a recession year (about 6 cents). He also claims that public and Congressional pressures have put the steel negotiations within limits that may make impossible a wage settlement without a strike (Page 30).

Union Organizing Drive Coming

Look for the AFL-CIO to launch the biggest recruiting drive in its three-year history. Labor leaders think that the taint of racket scandals is wearing off and that the climate is once again good for membership campaigns. The union's executive council has voted to raise \$750,000 in the next six months for organizing. Method: Increased contributions from member unions. One target: Whitecollar workers.

McDonald Sounds Off on Demands, Steel Costs, Imports

Here's about what United Steelworker President David J. McDonald wants in his new contracts with the steel industry to be negotiated this summer: Some 11 or 12 cents in direct wage increases, shorter hours without reduced pay, cost of living increases granted since 1956 written into the base rate, liberalized Supplemental Unemployment Benefits (Page 31). Mr. McDonald charges industry's import fears and claims of labor-induced spiraling costs are nothing but a "smoke screen" to hide the facts.

Effective Labor Reform Unlikely

Expect any labor reform bill passed by Congress this session to more closely resemble the one offered by Sen. John F. Kennedy (D., Mass.) than the 20-point plan offered by President Eisenhower. The AFL-CIO is formally

backing the Kennedy bill; it'll fight Ike's proposals to ban secondary boycotts and "blackmail" picketing.

Meet Conrad Cooper, Steel's Bargaining Chief

Meet Conrad Cooper, who will be chief of the steel industry's contract negotiating team, when it meets with the steel union in New York next May. The U. S. Steel Corp. executive is considered "a tough bargainer" by labor men, some of whom think he's dictatorial. But others concede that "he always goes in a straight line, never deviates" (Page 32). Other members of Mr. Cooper's bargaining

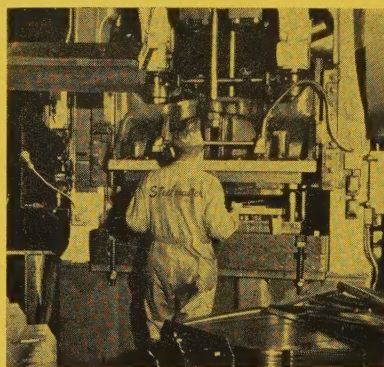

committee will be R. H. Larry of U. S. Steel, John Morse of Bethlehem Steel Co., and H. C. Lumb of Republic Steel Corp.

Bulletin F Revision May Be Buried

A revision of Bulletin F (the long awaited redo of the government's schedules of useful lives needed in depreciation calculations) has been completed by a committee working for the Treasury Department. But it may never be released. Treasury is reported to be considering sending legislation to Congress for depreciation reform this session (STEEL, Mar. 2, p. 69). While the matter is under consideration, Bulletin F will be held up. If reform is passed, Bulletin F perhaps would not be needed, or the present revision would not be adequate under the new law.

Prospects for Stampers Brighten

Hedge buying against a possible steel strike is giving the stamping industry an outstanding first quarter; business this year is expected to be 10 per cent above 1958's. One factor that's helping contract shops: The mortality rate of captive shops. Stampers look for price relief this year. Sharp competition has held rates to the 1957 level; they hope to pass rising steel costs along to buyers (Page 29).

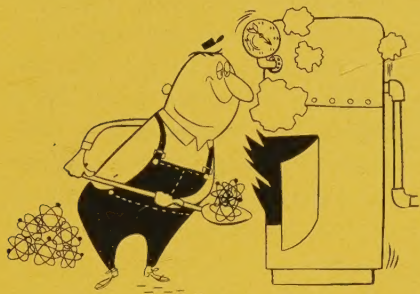

Oxygen Use To Rise in 1959

Look for U. S. oxygen production to exceed 80 billion cu ft this year, vs. about 60 billion in 1958. So predicts William M. Haile, president of Union Carbide Corp.'s Linde Co. With all the publicity about oxygen in steel-making, you may forget that welding uses are gaining, too. He predicts

Linde's distributor sales of oxygen, other industrial gases, and apparatus will rise 8 to 10 per cent above last year's.

How Good Is the Atomics Business?

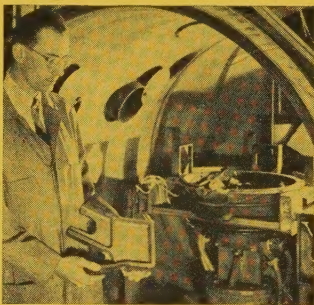

The atomic energy industry has failed to develop as predicted five years ago. Now its rate of growth is hanging in the Congressional balance. Towering costs are keeping business from buying nuclear control devices, and the AEC, trying to live within the budget, can't push a bigger civilian power program (Page 44).

German Steel Output Off in '58

German production of pig iron, ingot steel, and finished rolled steel fell off in 1958. The industry operated at 80 per cent of capacity, down from 95 per cent in 1957. Comparisons: Pig iron output was 16.7 million tons, vs. 18.4 million tons in '57; ingot steel, 22.8 million tons, vs. 24.5 million tons in '57; finished steel, 15.2 million tons, vs. 16.4 million tons in '57. About 85 per cent of German steel output is used domestically.

Reactive Metal Furnace Eliminates Cooling Hazard

STEEL gives you a look at a new concept in vacuum arc melting for reactive metals such as titanium. A heavy skull is maintained in the crucible. It acts as a heat sink, handling the heat generated during melting. Costly cooling systems are not needed; and there is no danger of water-reactive metal explosion. The furnace can be used for semi-continuous production (Page 64).

Putting the Directors To Work

Corporate directors are beginning to roll up their sleeves and exercise active management in the boardroom, a study by National Industrial Conference Board shows. Increasingly, directors are being selected for their specialized knowledge and the amount of help they can give to operating executives, reports the NICB. Nearly a thousand industrial and commercial firms, two-thirds of them manufacturers, participated in the study. The trend among them shows that board members are spending less time on routine reports and reviews of assets; they're devoting more time to consulting company officers on management problems. To attract qualified men, many firms are paying higher director's fees. They're trying to develop balanced

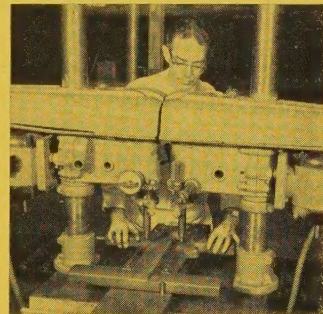

boards representing company management, outside interests, and experts in general management.

Volkswagen Predicts European Mergers

Manuel Hinke, export manager of Volkswagenwerke, Wolfsburg, Germany, says that mergers of European automakers in future years will produce a group of several ruling companies, similar to the U. S. pattern. He predicts the unions will be prompted by competition stemming from higher production and the Common Market. Mr. Hinke says Volkswagen is likely to affiliate with German or European companies now producing medium and higher priced cars to enable the state administered firm to compete at different price levels.

Extra Miles from Your Machines

Special setups of standard machines may help you on production jobs. A builder of drill presses has found some unusual ways to put the machines to work (Page 68). In addition to the normal jobs, the company is using the machines for routing, milling, and other work normally done with different types of machines. Results: The drill press becomes a more versatile production tool.

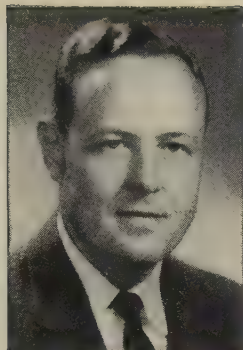

RCA Officer Warns of Lag in Knowhow

Dr. Douglas H. Ewing, vice president of Radio Corp. of America, told RCA Institute graduates that the U. S. is suffering from "unplanned obsolescence" in technical skills. He cited what he termed "an alarming gap" between those who work at the frontiers of science and the technical understanding of the layman. Dr. Ewing said it is increasingly difficult to keep our technical knowhow abreast of modern scientific progress; he called on technical personnel to recruit others in scientific training.

Straws in the Wind

A new aluminum tank for pole-type distribution transformers has been developed jointly by Westinghouse Electric Corp. and Reynolds Metals Co. The tank has extruded aluminum fin sections and ribs . . . World steel production was 301 million net tons in 1958, down from 322 million net tons in 1957, says the Commerce Department. Red China claims to have more than doubled production last year; only France and the USSR recorded gains among other major producers . . . Harry B. Benford, naval architect at the University of Michigan, recommends that the U. S. Army Corps of Engineers design the new lock at Sault Ste. Marie to handle ore carriers up to 1100 ft long.

March 9, 1959

New Boom in Steel!

Another chapter in the story of the fantastic growth in steel is about to be written. It is a story you will want to watch unfold as a guide in your planning.

In the last 20 years, the steel industry has expanded in waves. The first wave was induced by World War II. Obsolete and uneconomical capacity was promptly junked when the war ended. Then a postwar boom, instead of an anticipated depression, brought another wave of expansion. The Korean War came along to bring the biggest wave of all. Even so, the country did not have enough capacity, so we had the current wave of the late 1950s. This is the way it happened:

	Million Tons
World War II expansion 1938-44	+ 15.3
Capacity abandoned 1945-46	- 4.3
Postwar expansion 1947-50	+ 13.0
Korean War 1951-55	+ 24.2
Current expansion 1956-59	+ 19.7

In 22 years, U. S. steelmaking capacity will have increased 67.9 million tons—from 80.2 million on Jan. 1, 1938, to an estimated 148.1 million on Jan. 1, 1960.

Will 148.1 million tons of capacity be enough?

Based on a population of 178 million and capacity of 147.6 million tons on Jan. 1, 1959, the steel industry can make 1660 lb per capita. Since production in 1959 is expected to be no more than 110 million tons, or 1235 lb per person, it looks as though present capacity is ample for some time.

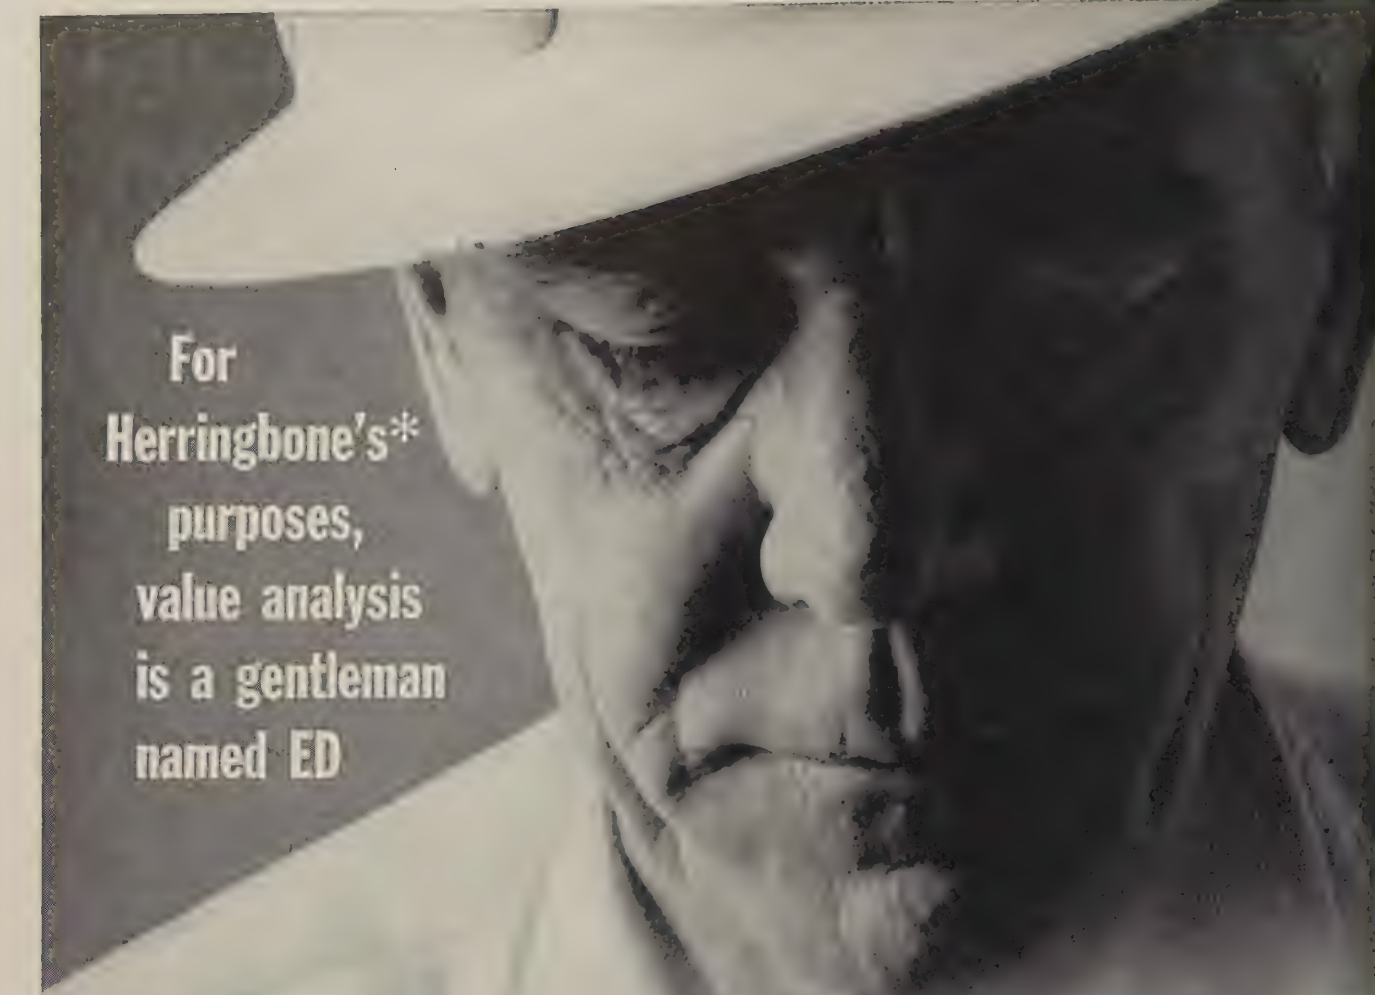

But steel industry planners know that is not true for two reasons: Growth in per capita consumption and population.

One company is spending \$300 million on a new program; two are spending \$200 million each; another is spending \$75 million; and two others are spending \$50 million each. Plans and sites for several more programs are ready.

Based on a population of 244 million and consumption conservatively estimated at 1600 lb per capita, the steel industry will need to add 47.1 million tons of capacity by 1975. The cost will be not less than \$16.5 billion.

So the steel industry is off on what may be a new boom running into the 1960s and 1970s.

Irwin H. Such
EDITOR-IN-CHIEF

For
Herringbone's*
purposes,
value analysis
is a gentleman
named ED

Or Joe, or Sven, or whatever the name of the man is in your organization whose opinion on wire rope you most respect. You can take all the value analysis forms ever made and fill them out and get some pretty promising answers. The straightest and clearest answer you'll ever get is from the head gentleman who *works* with the rope; the same man who comes back to you and tells you that the rope he works with *doesn't work*.

We take this stand because the new Roebling Herringbone is championed by men who work with it — the first to feel the impact of a wire rope's success or failure — and the first to tell you about either.

Roebling Herringbone—the two-ropes-in-one rope—is doing things that construction operators find hard to believe—but love to admit. It has prompted a series of some of the nicest testimonials you ever saw.

When you come right down to it, their satisfaction is twofold; after all they are working with both a Lang lay and regular lay rope in one. So they are getting the best that both types of rope construction have to give ... and that's plenty.

If you want to write us and get some pure, unadulterated field reactions, opinions from men who count, just drop a line to Wire Rope Division, John A. Roebling's Sons Corporation, Trenton 2, New Jersey. With these, we'll take the liberty of sending you the complete information on the rope that makes value analysis a sure thing by the mere specifying ... Roebling Herringbone.

*Reg. Appl. For

ROEBLING

Branch Offices in Principal Cities

Subsidiary of The Colorado Fuel and Iron Corporation

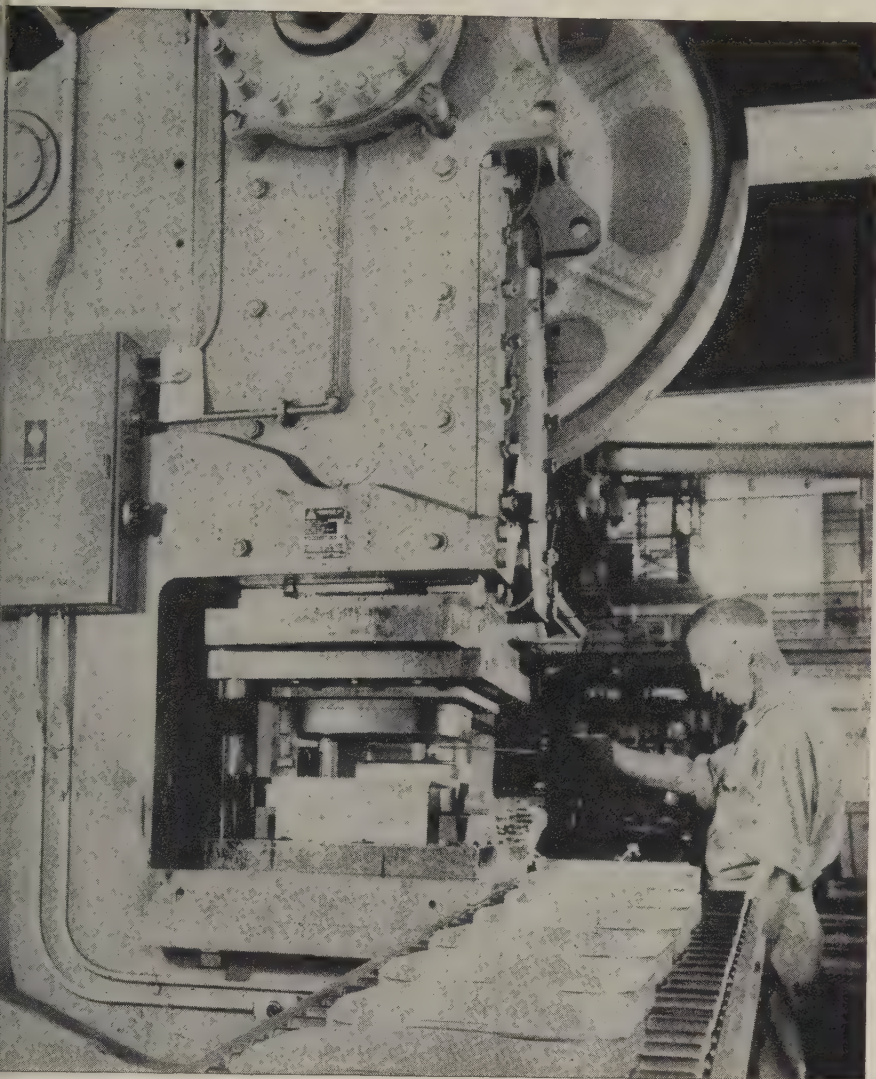

Two pairs of Lang lay strands provide greater flexibility.

Heavier outside wires of each strand have greater resistance to abrasion.

One pair of regular lay strands provide superior stability.

HERRINGBONE

Bellwether Stampers See Steady Business Upturn

AS AN INDICATOR of metalworking activity, the stamping industry is showing a lot of early strength; prospects are for a 10 to 15 per cent improvement over last year. The uptrend is broad geographically, with a few soft spots between New England and Minnesota.

Many job shops in the East look for a good year. One enjoyed a 50

to 60 per cent pickup in orders this quarter. In Ohio, another contract shop reports bookings are "way up." It has just completed the biggest three months in its history. But a Minneapolis plant reports the outlook only "a little brighter." Buyers are doing a lot of shopping, no buying.

The pickup is right in line with

predictions made last year (STEEL, June 2, 1958; p. 105). Stampers, then at the bottom of a 35 to 50 per cent slump from 1957, looked for a rise in the fourth quarter—real health by January.

• **Who's Buying**—Stampers with mounting backlogs credit much of the ordering to hedge buying prompted by an expected steelworkers strike in June. One executive says he will have laid in three times his normal steel inventory by May. One auto supplier says the carbuilders are hedging; he has started tooling up for small car parts orders.

Worcester Pressed Steel Co., Worcester, Mass., has bought more steel since December than it did in the first six months of 1958. Folke A. Erickson, general sales manager, says orders represent a cross section of customers, from missile and aircraft plants to the marine and boat-building industry. Widespread shopping inquiries by both the government and consumer product makers (mixers, blenders, home appliances), presage a promising second half.

• **Price Squeeze**—Stampers report prices have not improved noticeably over the 1958 level; they hope for an increase in the second half. They have not been able to pass rising steel costs on to their customers and report that industry pricing is still "extremely competitive."

Labor requirements are edging up slowly as the upturn gains momentum. Of employers queried by STEEL, most indicated an employment increase of 2 to 5 per cent. At least one manufacturer is back to "normal" employment levels.

• **Major Factors**—The ratio of contract shop volume to captive volume is undergoing considerable change, say industry sources. While it's hard to generalize, manufacturers say that automotive and electronics captives are growing; in the consumer appliance field, they are declining.

Two views are clear: Harold A. Daschner, managing director of the Pressed Metal Institute, feels that

captive establishments are being abandoned as users review the vital make-or-buy decision and turn their floor space to more profitable uses. Clement C. Caditz, president of Northern Metal Products Co., Franklin Park, Ill., travels widely through the industry; he says the high attrition among captives is being reflected in increasing job shop volumes.

Mr. Caditz also says that a surge in new tooling purchases in the last few weeks probably spells an upturn in new product introductions, since recent practice has been to modify product designs, then rework the old tooling.

German Autos Up 25%

West German auto production spiraled 23.3 per cent in 1958. The nation retained its position as the world's largest automobile exporter and second largest producer. In making over 1.5 million vehicles, it more than doubled the increase of 1957.

Exports zoomed 25.5 per cent, totaling 733,100 units, compared with 584,000 the previous year. Exports accounted for 49 per cent of production.

Germany's "Big Four" include Volkswagenwerke GmbH (Volkswagen), Daimler-Benz (Mercedes-Benz), which acquired Auto Union (DKW) last year, Adam Opel AG (Opel), GM's subsidiary, and Ford Werke AG (Taunus), Ford's German plant.

Nuclear Ship Being Built

Mallinckrodt Nuclear Corp., St. Louis, is shipping enriched uranium oxide to the Babcock & Wilcox Co., New York, for use in the nuclear merchant ship, *N. S. Savannah*. B&W will supply the nuclear propulsion system, including the reactor. The ship represents the efforts of the Atomic Energy Commission and the Maritime Administration. New York Shipbuilding Corp. is the hull contractor.

Scaife Adds Kellogg Line

Scaife Co., Oakmont, Pa., has taken possession of the air compressor line of Kellogg Div., American Brake Shoe Co., Rochester, N. Y. It will be operated as Kellogg-American Div., Scaife Co.

Peaceful Steel Settlement?

Probably not, says Princeton's Prof. Richard A. Lester. Public and Congress have backed contestants into a corner. Workers will get 8 cents an hour, strike or no, he says

"THIS YEAR'S settlement in steel will not be more than a couple of cents better than last year's settlement in autos, whether there is a steel strike or not," says Prof. Richard A. Lester, Princeton University.

But he adds: "Publicity, past complaints, and Congressional investigations—to say nothing of threatened investigations—have tended to put the steel negotiations within limits that may make impossible a wage settlement without a strike."

• **Careful Analysis Needed**—Professor Lester told the Associated Industries of Cleveland last Thursday that the issue of wage-price inflation is sure to be the center of conflict when negotiations for a steel labor contract begin in New York on May 20 or 21. He feels there is a tendency to simplify the matter by laying the credit—or blame—at the doorstep of the unions. "It just won't do to say the wages have risen faster than productivity and that unions are responsible for the price rise. Wages have risen faster than productivity in all inflationary periods."

"In all countries, except a few like Germany and Switzerland, prices

have been rising faster than they have in the U. S. . . . Other factors, such as the cold war, farm price supports, rising taxes, political pressures for full employment and against monetary restraints, and rapid technological change are much more important (than union-management negotiations) in determining broad movements in the price level," he contends.

• **Villain in 1956**—Professor Lester feels the industry paid too high a price in ending the 1956 strike. "But the villain in the wage-price spiral, in part, has been the long term agreement, and we can't have the advantages of such agreements, in terms of stability of relationships and reduced loss from work stoppages, without paying the cost in terms of upward pressures on prices."

That agreement gave workers an automatic improvement in wages and cost-of-living increases totaling about 8 cents an hour in 1958 during the sharpest recession of the postwar era and set the standard for auto negotiations last year.

• **Which Comes First?** — "It has been said that the steel negotiations will set the pattern this year. But in a real sense the long term agreements that do not expire this year, especially those renegotiated last year, will largely establish the pattern," he declares. The steel union will feel compelled to get more in a recovery year than the auto union got in a recession. "Auto workers got an annual improvement of 2½ per cent of base pay or 6 cents an hour.) He points out this has been the case in every year since 1954. Average hourly pay in both industries was equal then, but by the end of 1958, the steel industry's average was more than 40 cents ahead of the auto industry's."

The importance of this pattern can be seen from the fact that half of the large agreements (covering 5000 or more workers) expire this year.

RICHARD A. LESTER

McDonald Sets Steel Demands High

"I WISH Senator Kefauver would learn to keep his nose out of my business," snapped David J. McDonald, president, United Steelworkers, at a Pittsburgh press conference.

Mr. McDonald popped off when asked about a proposal made by the senator: The steel industry should forego a price increase if the steel union limits its wage demands to an amount equal to the average increase in productivity.

Asked if American labor was pricing itself out of world markets, Mr. McDonald retorted: "Absolutely not. That's just a smoke screen put up by industry to make the steelworkers dissatisfied with their union."

He also stated the declining margin of exports over imports was not unusual. It happened during the 1954 recession. "If all the steel being imported were made in the U. S., over 99 per cent of the workers now unemployed would still be out of work," he said.

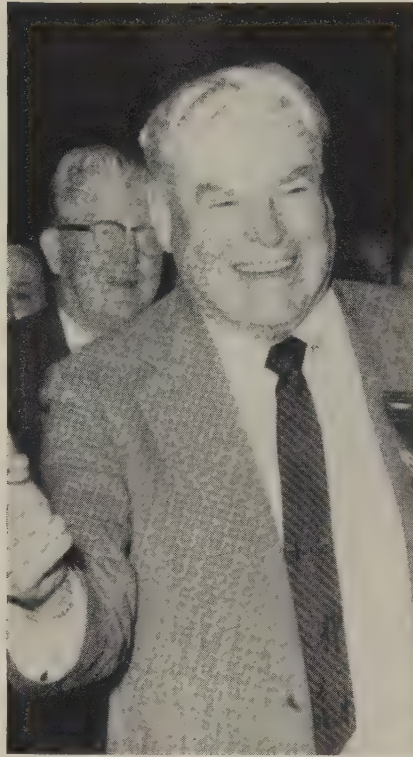

Demands Full Employment—Mr. McDonald, who is ready to negotiate "tomorrow" for shorter hours and higher wages, declared: "We must have full employment in steel. Only people have purchasing power. Industry will eventually have to face up to the need for a shorter workweek if we are to have full employment."

No Compromise — Would the USW agree to moderate its demand if industry promised to hold the line on prices?

Mr. McDonald's reply: "I think we got caught on that one in 1948. We won't fall for that again."

He still favors his extended leave proposal. Workers would get three months' paid vacation after five years' service. They'd also get normal paid vacations during the five years. Such a program is used in Australia. The USW president figures an extended leave program would cost industry no more than 2 cents an hour and would create 25,000 to 30,000 jobs.

It would cost less than the short workweek, he said. Example: If

David J. McDonald, United Steelworkers' president, says industry must face up to the need for a shorter workweek to provide full employment

a steelworker gets \$3 an hour for a 40 hour week, that's \$120. If he works 36 hours for the same \$120, the hourly rate jumps to \$3.33.

On other specific demands that the union might make, Mr. McDonald was more cautious. But some sources indicate that he'll ask that the 17 cents paid as cost-of-living increases since 1956 be written into the base rates this year. That's not as simple as it sounds; it creates wage inequities. Add 17 cents to the hourly rate for each classification, and you flatten the scale. To preserve the current relationship, the spreads between job classes would have to be widened. So the 17 cents would actually cost about a quarter.

Steel Strike? — Mr. McDonald said it's traditional that his people do not work unless they have a contract. But there have been extensions. One may come when the present contract expires June 30, he

added. He remarked that the size of steel inventories in consumers' hands will affect negotiations.

Commenting on an estimate by Roger Blough, chairman, U. S. Steel Corp. (a 1 cent increase in hourly wages would eventually cost industry \$30 million a year), Mr. McDonald claimed: "Another example of the smoke screen. In December, we had 450,000 steelworkers employed in production and maintenance. If you figure 2000 hours a year for each man and multiply by a penny, that's \$20 per man. Then multiply by 450,000 and you get \$9 million, not \$30 million."

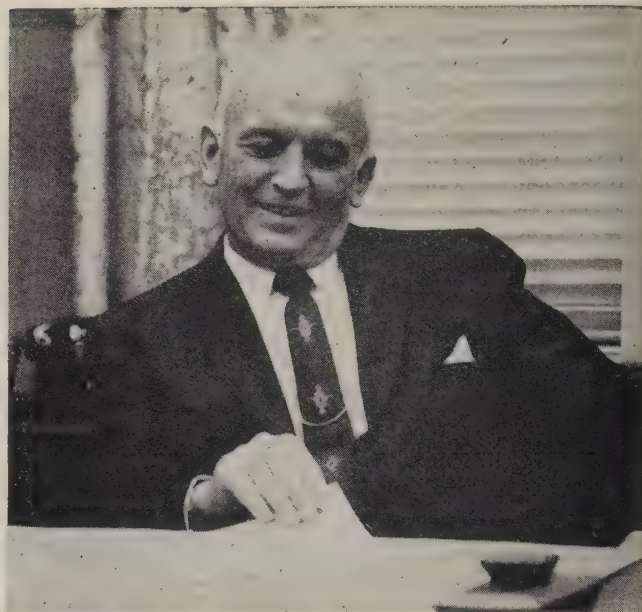

Mr. Blough's calculations are more detailed than Mr. McDonald's. Every penny pay boost adds \$15 million to direct employment costs because of the wage hike, higher overtime expense, built-in factors, such as greater social security payments, and other reasons. Mr. Blough also points out, as similar wage boosts in other industries are reflected in such items affecting steelmaking as purchased goods, services, and taxes, the indirect steel employment costs soon mount to another \$15 million.

Blasts Industry—Pinpointed on the import situation in barbed wire, plates, bars, and tubes, the USW chief cited the barbed wire case as "talk being generated by a few producers." He continued: "They've brought the trouble on themselves because: 1. They haven't kept pace with improved technology of European producers. 2. They aren't using as good equipment. 3. They've raised their prices to exorbitantly high levels. 4. The Europeans are making steel for barbed wire by the bessemer process which is cheaper. 5. American firms are doing all this importing." But he claims that foreign wire isn't as good and won't last as long as ours.

"Is America to be deflated to the economy of the thirties?" Mr. McDonald asked. "Has anybody stopped to consider which is a greater calamity to the people of this great and dynamic nation—the high cost of living or the high cost of want?"

"It seems evident that we are well on the road to becoming noncompetitive with foreign industries."

"From 1940 through 1957, total employment cost per manhour at U. S. Steel rose 8 per cent per year compounded annually."

Meet New Bargaining Chief for Steel:

CONRAD COOPER was noted for his ability to hold the line when he played football.

As chief negotiator for the steel industry in this year's contract talks with the United Steelworkers, he'll try to hold the inflation line, one of the toughest assignments of his career.

An executive vice president of U. S. Steel Corp. (personnel services) since February, 1958, Mr. Cooper succeeds John A. Stephens as the industry's chief bargainer. Mr. Stephens, former USS vice president in charge of industrial relations, was chief negotiator from 1943 to 1956, when the three year contract expiring June 30 was signed.

• **No Newcomer**—Mr. Cooper has been solving problems in industrial engineering and labor relations since 1929. Shortly after graduation in 1926 from the University of Minnesota he went to work as a field engineer for Universal Portland Cement Co., a U. S. Steel subsidiary.

From 1929 to 1937, he worked for a New York consulting firm which helped companies evaluate jobs, improve methods, and install incentive systems. In 1936, he went to Wheeling Steel Corp. as assistant to the vice president in charge of operations. Three years later, he became assistant vice president. In his Wheeling tenure, he faced John L. Lewis in coal negotiations.

• **Biggest Achievement**—In 1945, U. S. Steel hired him as assistant vice president in charge of industrial relations. He sat in on the 1945 contract negotiations and he began the task for which he is best known today: Direction of an industry committee which sought to eliminate wage inequities. Working for two years with representatives of the USW, Mr. Cooper and his associates compiled a manual of job descriptions and reduced 1000 jobs to 32 classifications. In 1947, they tackled the second part of their assignment—elimination of inequities on incentive jobs. It was a five year struggle. "We never did

agree on how measurements should be made," Mr. Cooper recalls. "In 1952, we reached a compromise that allowed the companies to set up incentives but permitted the union to challenge them."

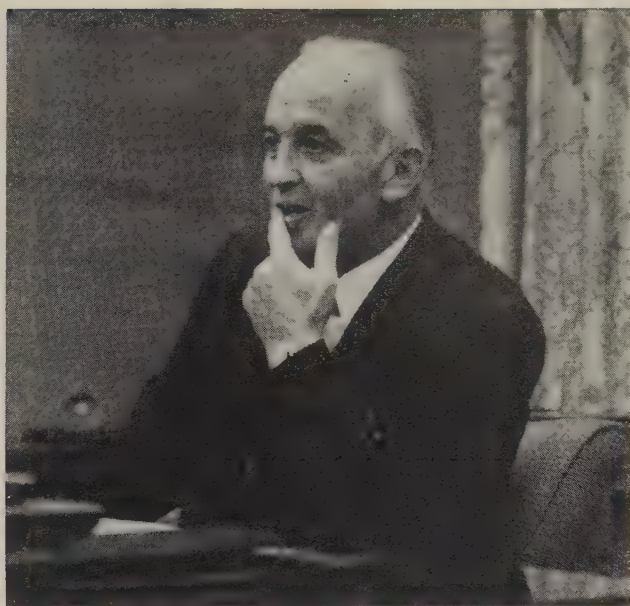

Mr. Cooper participated in the contract negotiations of 1947, 1949, and 1952. He was appointed vice president-industrial engineering in 1948 and vice president-administration planning in 1955. He was not involved in the settlements of 1954 ("There was no need for my direct participation") or 1956 ("I had a different job that year").

• **Strong Personality**—At 55, Mr. Cooper is big and solidly built. He apologizes if he has to give a long answer. ("I didn't mean to make a speech.") Like most engineers, he has a high regard for facts and a no-nonsense approach to problems. In bargaining sessions, he puffs on a cigar until his opponents quit talking, then makes an offer.

Union leaders have a high regard for his ability. They have coined the word, "Cooperized" (lulled into

"During this same time, our shipments of steel products per manhour rose 2.4 per cent per year compounded annually."

"Since 1950, the American steelworker has received more in wage increases than his German counterpart gets in total wages."

R. C. Cooper

believing that concessions are being granted). Never a word mincer, he impresses some labor officials as dictatorial. Others like his approach. Says one: "He always goes in a straight line, never deviates the way most of the industrial relations boys do. He'll give you a yes or no answer whenever he can."

• **Pros and Cons**—If Mr. Cooper has any advantage over his predecessor, presumably it's a bigger title. As an executive vice president, he should be able to cut through much of the red tape that delayed decisions in other years.

On the debit side, it might be said that he lacks John Stephens' ability to keep cool. "Cooper will take a reasonable amount of criticism, but he won't stand for personal abuse," a USW official declares. Adds a well-informed observer: "He's a man of tremendous capacity, but how well will he adapt to the personality clashes?"

• **Noinflationary?**—Mr. Cooper is concerned about the loss of domestic

and foreign markets to European and Japanese producers whose labor costs are less than a third of ours.

He declares: "It seems evident that we are well on the road to becoming noncompetitive with foreign industries.

"Steel imports rose to near record levels in 1958, despite a sharp decline in the domestic market for steel products. The 1958 steel imports increased by more than 30 per cent over 1957's, while shipments by domestic steel producers decreased by about 25 per cent.

"This is a situation that should be brought home to everyone in this country. Surely there must be some way for those so closely joined together—the customers, suppliers, employees, and stockholders—to join hands for the mutual benefit of all concerned instead of using force against each other. Common understanding of the mutual problems, rights, and obligations of people joined in the enterprise is the necessary steppingstone. I believe the burden of developing such understanding must fall upon supervisors."

• **What Labor Expects** — Union leaders think Mr. Cooper will strive to eliminate Section 2-b from the next labor agreement. Reason: It

prevents management from reducing crew sizes on jobs where there have been no technological changes (past practices in wages, hours, and conditions of employment must be maintained for the life of the contract).

One USW official figures that incentives will be a big issue, too. Says he: "Cooper favors incentives, but he wants to keep the lid on. He doesn't think a man's incentive earnings should exceed 50 per cent of his base pay. Some of the incentives in effect are paying more than 100 per cent of the base rate."

• **Biography**—Mr. Cooper was born in Beaver Dam, Ky., where his father was a coal miner, operating a small mine. The senior Cooper packed his family into three covered wagons when Conrad was young and moved to South Dakota. The son grew up in the ranching, cattle-raising environment of the West. In his youth he was a cowpuncher and rodeo participant.

Steel Talks Begin in May

The crucial bargaining sessions between the steel industry and the United Steelworkers of America will probably begin May 20 or 21 in New York at the Hotel Roosevelt.

How Basic Metal People Can Better Serve Customers

(Respondents checked factors most important to them)

	All Functions	Corporate Officials & Gen. Mgrs.	Production	Engineering	Purchasing
Maintain Closer Tolerances	43 %	39 %	49 %	46 %	46 %
Improve Physical Properties	35	29	42	41	37
Better Delivery	34	37	35	21	39
Carry Larger Stocks	21	25	11	16	23
Provide Informative Literature	20	20	16	31	15
Increase Workability	20	16	25	25	22
Employ Better Trained Salesmen	13	16	6	12	15

Source: STEEL survey.

Here's What Buyers Want From Basic Metal Industry

BASIC METAL producers can do a better job if they heed the thinking of decision makers in the four prime metalworking functions.

Buyers are influenced by many factors when they select basic metal suppliers, but at the top are the old fashioned PDQS—Price, Delivery, Quality, and Service with service given first consideration by managers who are responsible for selecting brands and supply sources. The opinions of these men were gathered in a survey by STEEL's Marketing Division.

Others factors: Managers want to deal with firms of known integrity

(27 per cent say so); only 15 per cent let the supplier's location affect the choice; and just 10 per cent think that engineering assistance would influence their choice.

Here's a breakdown of the thinking by management functions: Administrative heads place service in the primary category. Production, engineering, and purchasing put emphasis on product quality. That may mean that the operating people, the men who are responsible for fabricating or otherwise using the supplies, are more conscious of material quality and uniformity because it makes their work easier.

• **How To Serve**—Backing this conjecture is the fact that people in the five prime management functions think that producers or distributors of basic metals should maintain closer product tolerances. Production managers know that downtime increases when weight and thickness ranges vary with stock changeovers. In finely set, automated lines, a 1/4 in. variance in the width of new sheets can call for a lot of machine resetting.

Production men (42 per cent) also believe that suppliers should improve physical properties of materials. New techniques are based squarely on better materials coupled with technical knowhow which accounts for the 41 per cent response by engineers.

• **Delivery Pressures** — Better delivery service is sought by purchasing managers—32 per cent of the men who get complaints from other departments when materials aren't available rated this one highly. They also indicated that suppliers should carry larger stocks.

Product literature is high on the engineering request list. At least 31 per cent feel that such information is a valuable tool.

Should workability of metals be increased? Production and engineering heads indicated that it should—25 per cent answered that basic metals producers and distributors could better serve them with metals that are easier to work.

Improved sales forces were low on the respondents' listing—only 13 per cent of the five management categories feel that better trained salesmen are needed. By function, the following decision makers have regular calls from salesmen: 36 per cent of the men in engineering; 46 per cent of the production managers; 71 per cent of the administrators; and 88 per cent of purchasing managers.

• **Buying Habits** — About 17 per cent of the metalworking plants buy from mills only; 15 per cent purchase stock from warehouses and distributors only; the majority (68 per cent) buy from all three.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

A. O. Smith Shifts Welding Rod Pricing

A. O. SMITH CORP.'s Welding Products Div. today (Mar. 9) initiates the first major change in the pricing format for welding electrodes in many years.

The result: Price reductions of up to 12 per cent for large purchasers.

- **Incentive**—The new setup offers a price incentive to the large users of electrodes in lots of 40,000 lb or over, says G. E. Kemper, manager of the A. O. Smith division. Previously, buyers in the 40,000 lb-and-over range paid the same as those buying 20,000 to 39,999 lb lots. The move also will enable distributors to obtain maximum pricing benefits in 20,000 lb lots, instead of 40,000 lb purchases as has been the practice in the industry and will allow them to enjoy a greater percentage of profit margin in the ranges where they sell 95 per cent of their electrode products.

The A. O. Smith action comes at a time when distributors and many large users of welding products are beginning to stockpile against a possible steel strike.

Ford Expands Steel

It will spend \$35 million in modernizing its Rouge plant. Job will be finished in 1962

FORD MOTOR CO. will spend \$35 million to modernize its steelmaking facilities at the Rouge Plant (Dearborn, Mich.).

The project will get going as soon as engineering plans are finished. Completion date: Mid-1962.

- **Capacity Up**—Blast furnace capacity will be increased by improving furnace stoves to boost temperatures. Open hearths will be renovated so they can use more oxygen. All ten units will get oxygen roof lances (two have them now) and fuel enrichment burners (four have them now.)

A bank of four soaking pits will be added to the 20 in the rolling mill. A fourth slab reheating furnace at the hot-strip mill and a new, 4-stand, tandem, cold rolling mill will be installed. Additional annealing facilities are planned.

Ford's ingot capacity as of Jan. 1, 1959, was 1,898,600 tons. That will be raised slightly. More important will be the higher potential for finished steel production. Ford will continue to make about half of its own steel; the rest is purchased outside.

- **Timeable**—Preliminary engineering work will be done by Ford. First orders for equipment will be let in the next 30 days. Equipment delivery and construction will start late this fall.

Magnethermic and Ajax To Merge

MAGNETHERMIC CORP., Youngstown, will merge (subject to approval by stockholders) with Ajax Electrothermic Corp. and Ajax Engineering Corp., Trenton, N. J., to create a fully integrated manufacturer of high and low frequency induction heating and melting equipment.

The merger is expected to be effected May 1.

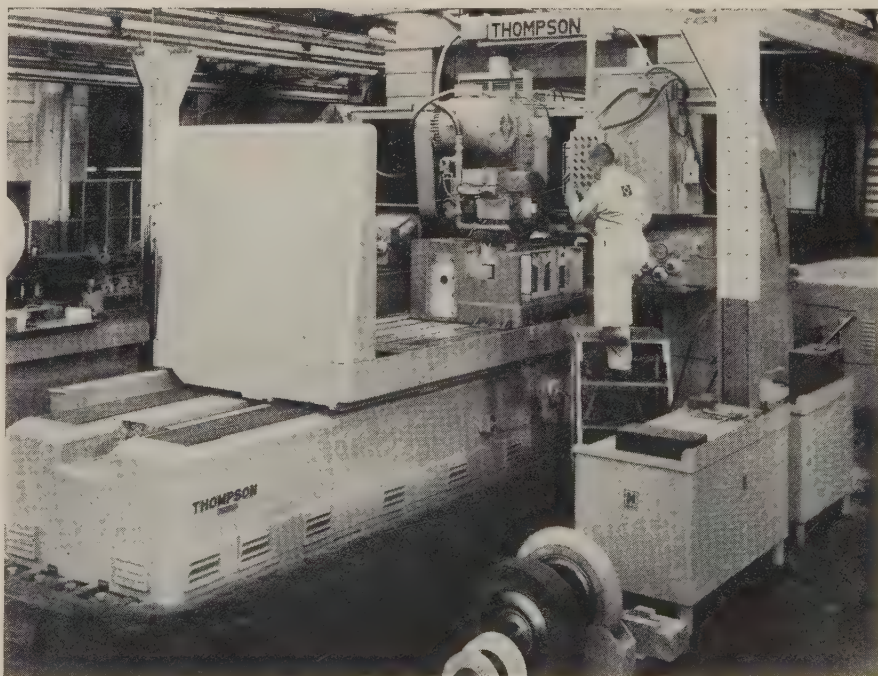

The new firm will be Ajax Magnethermic Corp. with headquarters in Youngstown. It will be largest in the field with anticipated sales of \$9 million a year. The merging companies will operate as divisions of the parent organization. Combined plants will have about 175,000 sq ft and employ over 300.

- **Not Competitive**—Basically serving the same customers, the firms were never directly competitive. Magnethermic produces high and low frequency heating equipment. Ajax makes melting equipment, Electrothermic concentrating on high frequency types and Engineering dealing with low frequency types.

- **Better Service**—Magnethermic reports the merger was initiated to give customers better service.

A large decentralized field service organization will be developed, resulting in improved service over a larger geographic region.

John A. Logan, Magnethermic president, will head the new company. The board of directors will be expanded to include Guillian H. Clamer, president of Electrothermic and chairman of Engineering.

THIS 75 TON SURFACE GRINDER, made by Thompson Grinder Co., Springfield, Ohio, is operating at Heald Machine Co., Worcester, Mass. It mechanizes the grinding of ways and substantially reduces hand scraping. Surfaces in any plane are ground to extremely close tolerances

Antisub's Potential High

Contract possibilities are bright as Navy steps up campaign to find better weapons for this type warfare. Russians are building more submarine tonnage than we are. Ratio is 6 to 1

INDUSTRY can best get into anti-submarine warfare (ASW) contracts through the National Security Industries Association.

"There's more industrial interest in this subject today than there has been in any other peacetime period," a Navy spokesman says. Many firms are putting their own money into this work. "One company," he adds, "has put 25 of its best brains on the job."

• **Why NSIA?** — Contractors, of course, must know what is required before they can begin work. That's why co-operation with NSIA is necessary. The organization helps you get security clearance. (For a complete rundown on contract possibilities, see next week's STEEL, Mar. 16.)

Increased public attention on anti-submarine warfare is guaranteed by such efforts as the Navy League's in Washington last week. Pressure on Congress is certain to result. The Navy League brought together 27

metalworking firms already doing business in ASW. They ranged from Acoustica Associates Inc. to Westinghouse Electric Corp.

Speakers from the U. S. Navy argued for more money for ASW. Warned Adm. Arleigh Burke, chief of naval operations: "In any future major war there will be no time to come from behind. The U. S. must deal with the enemy submarines effectively with the weapons systems available from the outset of the conflict." Rear Adm. Charles Weakley noted the Free World operates 90 per cent of the world's ships, while the USSR runs about 60 per cent of the antishipping submarines. "Our forces are minimal," he pointed out. Since 1950, the Russians have outbuilt us in submarine tonnage by a ratio of 6 to 1; 9 to 1 in destroyers; and 14 to 1 in cruisers.

• **What's Needed?** — "With planned production," said Capt. Richard Laning, we could have 30 to 40 nuclear ASW subs by 1965. By then,

our present diesel fleet of 100 will be over 20 years old. Another vital part of ASW: Aircraft, both fixed wing and helicopters. Vice Adm. Robert Pirie reported a need for a "breakthrough in detection capability." He wants aircraft to detect a sub at a depth of 1500 ft when it is 50 to 75 miles away.

New weapons exhibited at the Navy League show: The Mark 44 torpedo made by General Electric Co.; and the Mark 52 and Mark 55 mines, products of the Naval Gun Factory, Washington.

• **Money Problems**—ASW is no different from any other military effort: Money is needed for more research and development. The fiscal 1960 budget about matches that of fiscal 1959.

Asked if ASW was to get an increasing portion of the Navy's budget over the next five years, Navy spokesmen noted they have to prove their needs before they get more money. We need "some rather surprising fruit from our R&D program. We are looking for inventions," sums up Vice Adm. William Cooper, commander, Antisubmarine Defense Force.

• **What's Ahead?** — Future ASW subs will look "more like supersonic aircraft," believes Captain Laning. A sub doesn't have to be big.

Chance Vought Aircraft Inc. exemplifies firms looking ahead: It is working on detection techniques, integration of aircraft into a complete ASW weapons system, advanced sonar, and the use of subs against attacking missiles.

Steel Drum Shipments Off

Shipments of steel shipping barrels and drums in 1958 declined to 31,643,379 units, compared with 35,701,323 in 1957, the Bureau of the Census reports. Movement in December amounted to 2,663,864 units, compared with 2,419,099 in November, and 2,399,333 in December, 1957.

Steel pail shipments in 1958 were 72,413,137 units, down from 73,678,085 the previous year. December shipments totaled 5,123,083 units, up from 4,992,050 in November, and 4,442,810 in December, 1957.

THESE STAINLESS STEEL PLATES, said to be the largest ever rolled, have been produced by G. O. Carlson Inc., Thorndale, Pa. Designed for pilot plant installation, they measure 451 x 184 x 2 in. and 461 x 179 x 2 in. Each has a finished weight of over 45,000 lb. Ingot weight was 65,000 lb

Metallizing cuts reject rates and costs with part reclamation and rebuilding

Metallizing Is Extended To Production Processes

CORROSION PREVENTION and part rebuilding count big in metallizing's future, but it also has a lot of potential in original production processes.

Example: Sprayed ceramic coatings for thermal barriers. Possible applications include jets, rockets, and nuclear projects.

• **Industry Reports**—The small industry is thriving. It's estimated that 6000 firms (including contract shops and manufacturing plants) use one or more metallizing guns.

Business is good, says SpraRod Corp., Cleveland. Equipment manu-

facturers confirm this. A 10 per cent gain in sales volume is expected this year by Metallizing Engineering Co. Inc., Westbury, N. Y. Metallizing Co. of America, Chicago, anticipates a similar rise.

• **Uses**—One automotive manufacturer sprays valves with aluminum for corrosion resistance under high heat conditions. After coating, the aluminum is diffused into the steel by heating.

A metal window manufacturer is considering sprayed zinc instead of other coating methods on lightweight units, says Akron Sandblast

& Metallizing Co., Akron. Claimed advantage: No heat distortion.

Automotive engine plants are reclaiming crankshafts and other undercut or mismachined parts and are gaining substantial savings. One metallizing official claims that sprayed molybdenum cylinder walls have been tested for Detroit's proposed aluminum engines. Tungsten carbide hard facing is also being done on such items as pump plungers.

Corrosion protection possibilities have not been tapped, says one metallizing jobber. Aluminum and zinc are stressed for corrosion protection. Typical applications include bridges, tanks, ships, and fabricated steel products. For extended life, many spray with zinc. It protects and is an ideal preparatory coat for organic coatings.

• **How?**—Metal or ceramics in appropriate wire, rod, or powder form are fed into a gun. An oxyacetylene flame in the nozzle melts the material, and the spray is propelled to a prepared surface. Spraying is essentially a cold process. The base material can be kept below 100° F to prevent warpage, distortion, or burning.

Paper and wood can be metallized. Mechanical bonding is good on cast iron, steels, alloy steels, nickel, lead, and aluminum. Coatings have been built up to 3½ in. thick. Grit or sandblasting is the most common surface preparation.

Kaiser Steel Starts Up Sand Conditioning Plant

Kaiser Steel Corp. has begun operating its new foundry sand conditioning plant at Fontana, Calif. It will speed the casting of ingot molds for Kaiser's oxygen steelmaking plant which went into production a little over a month ago (see STEEL, Feb. 9, p. 88).

The installation for recovering and conditioning special foundry sand includes an automatic shake-out, a rotary cooler (made by Standard Steel Corp., Los Angeles), fines removal system, storage facilities, and blending machinery.

Kaiser makes ingot molds ranging from 2 to 36 tons each in the foundry for use at the Fontana steel plant.

OCDM Is Firm on Imported Turbines

KEEP YOUR EYE on the Buy American fight going on between the Office of Civil & Defense Mobilization and General Electric Co.-Westinghouse Electric Corp. At issue is the whole matter of imports of equipment and other goods produced at lower costs overseas.

Here's the background: Tennessee Valley Authority last month bought a 500,000 kw turbogenerator from C. A. Parsons & Co. Ltd. in England. TVA had informed the Americans it would pay 20 per cent more to keep the work at home, but Parsons' price was 50 per cent under that of GE and Westinghouse.

Both companies put their case this way: Award of the contract to Parsons constitutes a threat to national security. By 1969, TVA will have half its total power capacity dependent upon foreign firms for maintenance and repair, says Westinghouse. "It is doubtful that a domestic industry could restore a Parsons unit to service without extensive delays."

Why Case Gets Nowhere

So far, the companies aren't making any progress with their case. Involved is the interpretation of the Buy American Act and Section 8 of the Trade Agreements Act (dealing with national security).

OCDM has initiated a survey of all electrical utilities in the country to determine whether foreign equipment breaks down easily or is difficult to maintain.

Until the results are in, the GE-Westinghouse case will be in abeyance.

Complication in Buy American Issue

Adding a complication to the already involved Buy American matter is the Greers Ferry Case. In that situation, the Army Corps of Engineers did not award a contract on two hydraulic turbines to the low (foreign) bidder.

The low domestic bidder, Baldwin-Lima-Hamilton Corp., got the job for \$1,757,210. English Electric Co.'s

bid of \$1,450,700 was 17 per cent less than B-L-H's. Under the Buy American Act, a U. S. firm automatically gets the order if its bid is no more than 6 per cent above the foreign firm's. B-L-H got another 6 per cent differential because it was in a labor surplus area, Eddystone, Pa.

The 12 per cent differential still wasn't quite enough to win the U. S. company the job. What tipped the scale was that its Eddystone plant had some 30 elephant tools (these giants weigh 25,000 to 750,000 lb and are worth \$50,000 to \$900,000 each).

To give Eddystone the turbine order was, OCDM reasoned, the best way to keep the elephant tools operating. Since 1955, it has been government policy to help industry obtain and use the big tools as a part of the mobilization base. Eddystone's employment is currently about half normal. If the plant were shut down, the country would be left with four plants capable of building the Greers Ferry type turbine. The importance of its 30 elephant tools is evidenced by a Commerce Department report that there are only some 1100 elephant tools in the whole country. They are spread over some 65 plants of about 40 companies.

OCDM argues that the Greers Ferry Case is completely different from the Parsons-TVA matter.

Army Argues for Arsenal System

Deep seated Army-Air Force rivalries boiled up again last week in Rep. Chet Holifield's (D., Calif.) hearings on missile management techniques (STEEL, Feb. 16, p. 98). The case for the Army's in-house method was stated by Maj. Gen. J. B. Medaris, commander, Army Ordnance Missile Command: "In dealing with the competitive, commercial world, we must be in a position truly to control our business. We must have technically competent people on the government payroll who have no conflicting interests, and who, therefore, can afford to be objective."

Under questioning, the general pointed out that his people were assured of a career in the field of their choice under the Civil Service system, but scientists and engineers working for a contractor might tend to perpetuate a missile system to assure themselves a job.

The apparent change in Army management techniques on the solid fueled Pershing was made, says General Medaris, because the Redstone Arsenal folks knew upcoming space projects would keep them busy. Martin Co. received most of the management work, with the exception of the guidance system, which was kept in-house. He implied the use of the Pershing technique once does not necessarily mean the Army will use it again on new missiles.

AF Adopts Jupiter Nose Cone?

Defending the arsenal system, the general added that the AF is applying Jupiter nose cone principles to its ICBMs, and may apply them to the Thor. He reported the Jupiter nose cone cost \$22 million to develop, while the AF has spent between \$180 million and \$300 million on its Thor-Atlas nose cone program.

Jet Planes to Barbecues— Man, That's Diversification

IF YOU FLY a jet plane, or if you barbecue a chicken in the backyard, you may be using an H & B product.

Not long ago, H & B American Machine Co. Inc., Culver City, Calif., was primarily a manufacturer of structural components for military and commercial aircraft. The firm foresaw the decline in manned aircraft, cutbacks, and stretchouts in defense spending. It decided to broaden its base.

Points Considered—H & B started acquiring diversified companies to be operated as divisions of the parent organization. Each company considered was screened on these points: 1. It must be in civilian business. 2. It must be making money. 3. It must have a market potential to underwrite its future as a continuing moneymaker. 4. It must qualify for the long pull.

Each proposal was studied as a new plant and new product project. When a favorable decision was reached and negotiations completed, purchase was made by cash, cash and stock, or cash and long term payout of profits.

Good Results—Thus far, H & B has obtained Big Boy Mfg. Co., Burbank, Calif., portable home barbecue manufacturer; General Trading Co., St. Paul, distributor of automotive parts and accessories, industrial supplies, and heavy hardware, and Quick Way Truck Rental Co., Denver, through a joint venture with Penn-Texas Corp., New York.

Diversification has paid off handsomely. Consolidated earnings for the fiscal year ended July 31, 1958,

were \$1.7 million, up \$245,000 from the previous year.

• **Personnel Retained** — Executives of acquired companies stay on the job. That's the key to H & B's continued success and rising profits.

"We believe people who are running a business at a profit know what they are doing and should continue in their management roles under the new ownership," says David E. Bright, H & B's chairman. "We offer what we consider a strong financial inducement for those executives to remain with us."

H & B uses its own management people for counseling the newcomers on occasion, but they are never directly in the plant except when the management team may be incomplete.

• **Defense Still Strong**—The firm's Aircraft Div. is still actively engaged in military aircraft programs, including work for the Boeing B-52 and Convair's B-58 and F-106. It also supplies components for the Boeing 707 and Convair 880 commercial jet airliners. But diversified products which can be introduced into the existing facilities at Culver City and Indianapolis are being studied.

The broad base H & B is building enables the firm to avoid putting all its eggs in the defense basket.

Group Seeks U.S. Contracts

Cleveland industry has started a drive to garner more U. S. defense business for the area.

Formed by 14 charter member companies, the Cleveland Aero-

Space Association hopes eventually to bid on government contracts for a group of 20 to 30 firms. A number of other Northeast Ohio defense contractors are considering alliance with the association.

President of the association is Robert J. Laws of Otis Elevator Co.'s Baker Industrial Truck Div., Cleveland. He sees the group as a tonic for Cleveland industry's "lethargy" in securing federal contracts. Support of some military men and members of Congress has resulted from a year's legwork by association founders, he says.

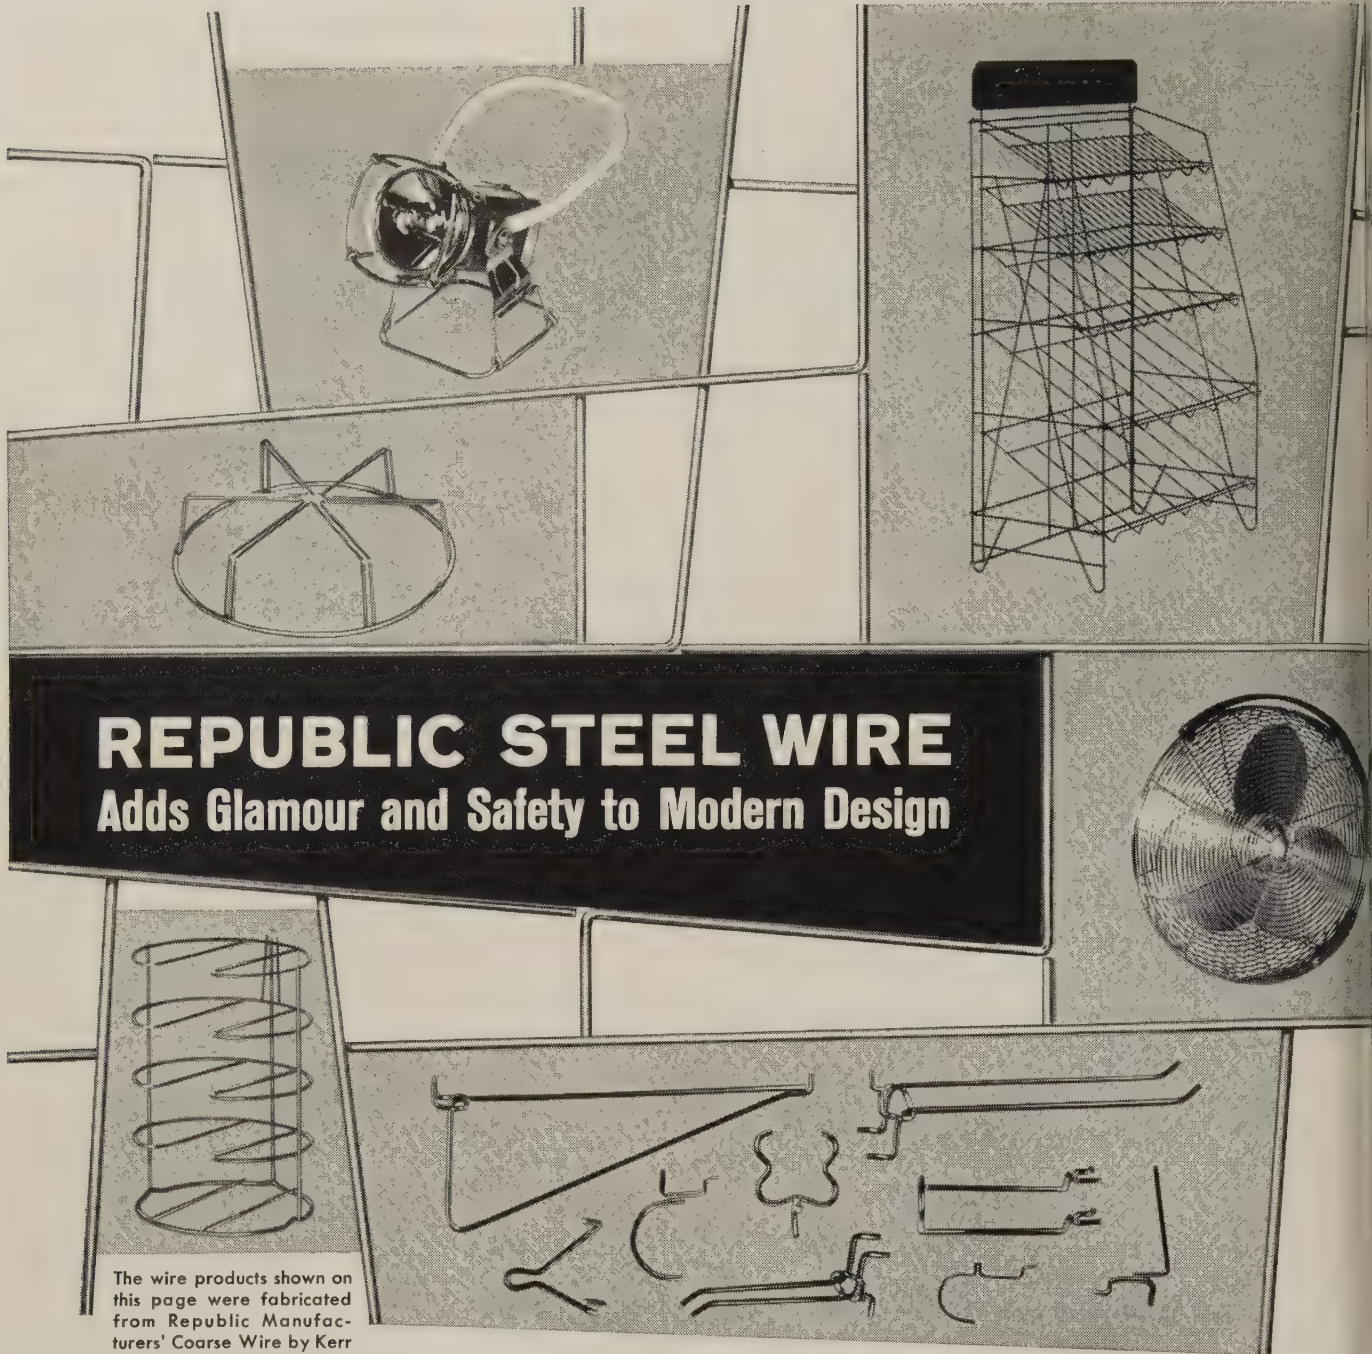

Initially, the group will try to land smaller projects (such as missile subsystems) and seek bigger budget items as experience, capacity develop.

Isotope Sales Jump in '58

A 37 per cent leap in volume of radioisotopes sold to private business brought 1958 sales of \$2.4 million to the Atomic Energy Commission's Oak Ridge National Laboratory.

Total shipments were only slightly above the 1957 figure, indicating that peaceful users of nuclear energy are buying in bigger quantities. The year's decline in dollar sales (from \$2.6 million in 1957 to \$2.4 million), reflects a cut in the price of cobalt 60.

The radioactive materials bought by private industry are used extensively for inspection, research, and material conservation (STEEL, May 12, 1958; p. 104). Private domestic suppliers sold \$467,917 worth of isotopes overseas, with the bulk of shipments going to Japan.

REPUBLIC STEEL WIRE

Adds Glamour and Safety to Modern Design

The wire products shown on this page were fabricated from Republic Manufacturers' Coarse Wire by Kerr Wire Products Company, Chicago, Illinois.

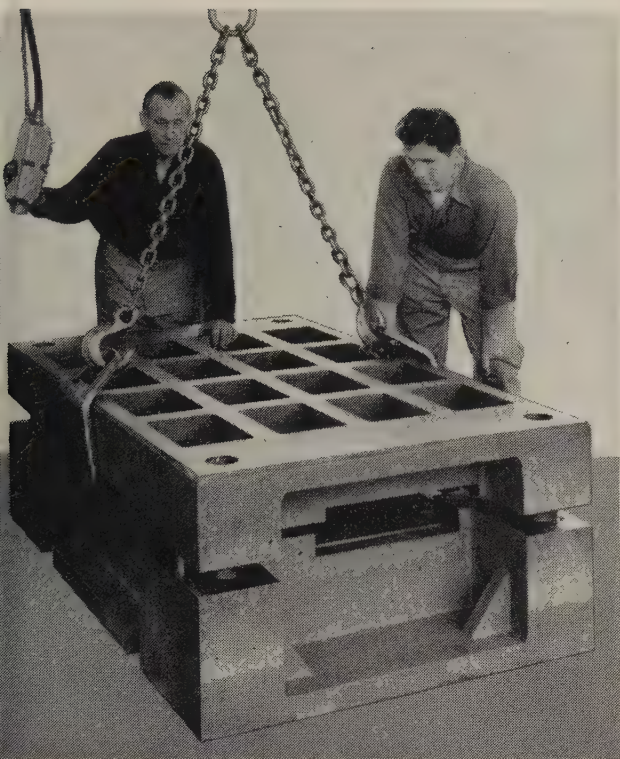

Manufacturers who produce a wide variety of wire forms, such as The Kerr Wire Products Company, find Republic's wire a valuable aid in meeting design requirements, minimizing losses, and stepping up production.

Uniform quality assures accurate, easy forming with adequate strength and rigidity, and is one of the reasons why Republic Steel Wire is specified for difficult design and forming problems. Up-to-date machines and methods, skilled laboratory control and careful inspection assure every purchaser of Republic Steel

Wire that it will suit his specific requirements.

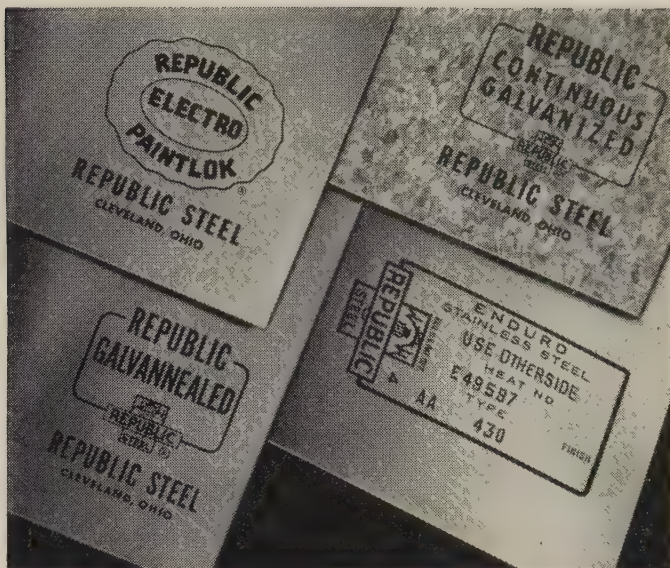

Republic produces wire in a wide range of sizes, grades, and finishes. Large tonnages are used to fabricate fan guards, wire partitions, racks, grilles, display stands, reinforcing specialties, threaded fasteners, and many other wire products.

Republic Wire Metallurgists are always available to work with your personnel in solving production problems. This service is obligation-free. Mail the coupon if you would like an experienced wire metallurgist to call.

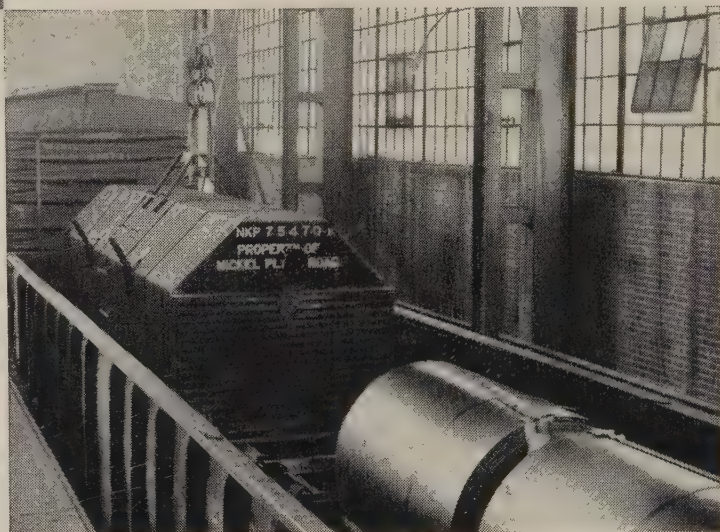

REPUBLIC PIG IRONS HELP PRODUCE highest quality die sets for the metal stamping industry. The Producto Machine Company, Bridgeport, Connecticut, casts die set parts in their own foundry using only raw materials with a definite known analysis, including Republic Pig Irons. The pig iron portion of the charge consists of equal parts of Chateaugay Pig Iron and Republic Malleable Pig Iron. The year-in, year-out uniform chemistry of these fine irons helps Producto produce high quality, laboratory-controlled castings. The company has found that there is no better, no more economical means for insuring strong, flaw-free, easy-to-machine castings. A Republic Pig Iron Metallurgist will give you all the facts on all Republic Pig Irons for quality castings. Mail the coupon today.

REPUBLIC COIL COVERS HELP PROVIDE shipping protection for coil users. These covers offer excellent weather protection, shut out dirt, stop vandalism, eliminate costly replacement of short-lived tarpaulins, eliminate the need for paper wrappings. Covers are easily handled by overhead or trackside crane and are designed for stacking. Republic Coil Covers measure 22 feet long, six feet wide, and six feet high. Two covers are used with each 42-foot gondola car. Send coupon for complete facts.

REPUBLIC STEEL SHEETS HELP PRODUCTION PROBLEMS VANISH. Whatever your product or production requirement, Republic can supply the right steel sheet to solve your problem. As a major producer of flat rolled sheets, Republic has developed and can furnish top-quality steel with the proper characteristics to provide easy fabrication and product dependability. Available in ENDURO® Stainless Steel, Electro Paintlok®, Continuous Galvanized, and Galvannealed. The coupon will bring you complete facts.

Process Steam & Space Heating: First Major Commercial Use of Atomic Power?

"This application of nuclear energy has largely been neglected or bypassed because of the seemingly greater potential in electric power generation—but the projected cost of a nuclear steam plant under certain conditions approaches competitiveness with a fossil fuel plant."

Here is a cost comparison of coal fired and nuclear steam plants capable of producing 150,000 lb of steam an hour at 150 to 200 psi:

	COAL FIRED	NUCLEAR
Investment:	\$1.5-2 Million	\$3.3 Million
Operating Cost Per 1000 lb at a rate of 1 billion lb per year	83 cents	\$1.04

If the nuclear plant investment could be cut to \$1.5 million, the cost of nuclear steam would be 76 cents per 1000 lb (assuming credit for the sale of plutonium created by the plant and no charge for uranium use).

Source: Theodore Marvin, president
Michigan Chemical Corp.
St. Louis, Mich.

Business Still Slow in Atomics

THE BRIGHT NEW AGE of atomic energy is getting a little tarnished.

• **Do We Need It?**—For the most part, benefits for metalworking in general are still to come because programs dreamed of five years ago have failed to materialize.

W. Kenneth Davis, vice president, Bechtel Corp., San Francisco (engineer and constructor of nuclear powerplants), says that by 1965, only 2 million to 3 million kilowatts of electricity will be produced annually in the U. S. by the atom. That will just about match the British program. He is not disheartened by his estimate, but in Congress, Democratic members of the Joint Atomic Energy Committee are. They feel this country has

lost its early lead in the field, because the government has failed to encourage the industry by big enough subsidies, or by doing the job itself.

At issue here are fossil fuel interests, who point out this country doesn't need cheap atomic power while the British do. We can wait until 1975 for our big effort, implies Philip Sporn, president, American Electric Power Co. The country will require 2 trillion (2000 billion) kilowatts in 1975, three times the needs of 1957. Only 7.5 per cent will be generated from nuclear power. By the year 2000, 6 trillion (6000 billion) kilowatts will be needed, and about 55 per cent will be from the atom. From 1975 to 2000, coal consumption will increase comparatively little: From 475 mil-

lion tons to 600 million tons annually. Nuclear power will account for over 75 per cent of the increase in electric energy generation from 1975 to 2000.

"I believe there is grave danger that so great an emphasis will be placed on atomic power development that we will tend to forget the essentiality of fostering the continued development of an adequate supply of coal, oil, and gas," warns Mr. Sporn.

• **Costs Leap**—Tremendous costs of nuclear power are also helping to lessen industry's love for the field. Yankee Atomic Electric Co., Rowe, Mass., figured a year ago that the cost of its first power operations would run \$33 million (including the reactor, land, buildings, support,

and electrical generating facilities). Today, it estimates costs at \$57.5 million, with the reactor costs alone having jumped from \$16.8 million to \$38.4 million.

James Fairman, senior vice president, Consolidated Edison Co. of New York Inc., notes the cost of his firm's facility rose \$10 million (to \$100 million) in the last year. The increase is "almost wholly attributable to price escalation."

Equipment Market—Earlier estimates of a \$4 billion equipment market during the next decade are discounted by industrial and Congressional sources alike, because they were based on the assumption of 6 million electrical kilowatts from the atom by 1968. The reluctance of the AEC to start big programs is also counted as bad news for equipmentmen.

Hopes for a stepped-up program are dim with the White House certain to frown on anything that might topple the precariously balanced budget. AEC has asked for just six new starts (20 are underway) in fiscal 1960. The AEC wants to stick with small prototype plants until the atom's competitiveness with coal (for the production of electricity) has been clearly demonstrated.

Industry may win higher subsidies. AEC is proposing a change in the law to permit federal grants up to 50 per cent of total capital costs of an atomic powerplant.

Republicans think AEC's program enough: \$130 million in fiscal 1958 for the civilian power program; \$182 million in fiscal 1959; \$249 million in fiscal 1960.

AEC reports industry spent \$70 million for the fabrication and construction of power reactors in fiscal 1959, compared with \$40 million in fiscal 1958.

Industry's Role—With no firm definition of industry's role in our atomic future set, some firms still have the corporate guts to go ahead on their own. Example: Michigan Chemical Corp., St. Louis, Mich. Three years ago, it started a study for producing process steam by a nuclear plant. With about \$50,000 of its own money and an "encouraging" letter from the AEC, Theodore Marvin, president, says the firm has produced a report which

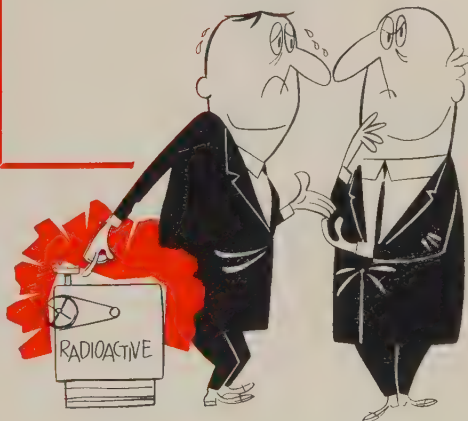

Industry Is Reluctant To Use Isotopes . . .

"We are only scratching the surface in isotope applications . . . why is it that these scientific principles which permit us to measure and control so swiftly and with such amazing accuracy are not actively adopted by management? American industry is still waiting to be shown, (and) information is not getting into the hands of the management people who are responsible for decisions," says Samuel Auchincloss, president, Tracerlab Inc., Waltham, Mass.

To get isotopes used by more companies, Mr. Auchincloss suggests:

1. The Atomic Energy Commission should invite potential users to explain where they may be able to apply isotopes; AEC would underwrite the cost of application engineering surveys and purchase the necessary equipment.

2. AEC would report the results of the studies to industry, thus encouraging the wider use of isotopes.

is a "good guinea pig." He wants the AEC to build the plant, let his firm operate it. He would pay for the steam produced at the conventional rate of about 90 cents per 1000 lb. (Michigan Chemical is in a high cost area.)

American Radiator & Standard Sanitary Corp. is also interested in process steam. "Once such a reactor has been successfully operated over a reasonable period of time, it will be able to produce steam at competitive rates for a substantial portion of the American market," predicts John Linsenmeyer, executive vice president. Looking farther ahead, he thinks the development of process steam plants would "indirectly expedite economic electrical power generation," because of the

experience industry would gain.

Industry's Reluctance—U. S. businessmen must also get used to the idea of everyday contact with radiation, as well as doing more development work on their own, suggests Industrial Nucleonics Corp., Columbus, Ohio. "Our gage installations expose process operating personnel to less radiation than is absorbed by wearing a luminous dial wrist watch," comments George Foster, vice president.

The cost of installing a measuring-control system in basic industries like steel, paper, and rubber: From \$15,000 to \$250,000. The savings: 4000 systems now operating save \$300 million a year in raw materials.

COAST-TO-COAST SATISFACTION!

...AMCHEM GRANODRAW SS *specified by leading metalworking manufacturers to improve drawing and cold forming of stainless!*

In the Amchem Granodraw SS process a thin, uniform oxalate coating is deposited on stainless prior to lubrication and working. This coating is instrumental in preventing metal to metal contact between work and tool, prevents galling and seizing, acts as a carrier for the lubricant to reduce friction.

Wherever it is used, Amchem Granodraw SS has proved its merits over competing products—in a finer, denser, more continuous coating of

greater penetrating power to coat contact areas. The result is a trouble-free, service-free product with basic user advantages of greater speed of draw, greater total reductions, longer tool life, easier inspection, finer finishes and more effective lubrication!

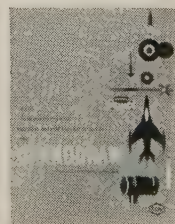

If you work in stainless, you'll work faster, better and more economically with Amchem Granodraw SS!

NEW AMCHEM SERSEAL* AVAILABLE OVER GRANODRAW SS BATHS!

Newly developed Amchem Serseal provides an effective chemical blanket over coating baths to prevent escape of heat and fumes. In actual field use, *heat savings of up to 70% have been reported*, with substantial reductions in cost and time required for maintenance of heating elements and elimination of costly ventilating systems! Call your Amchem man or write for full details.

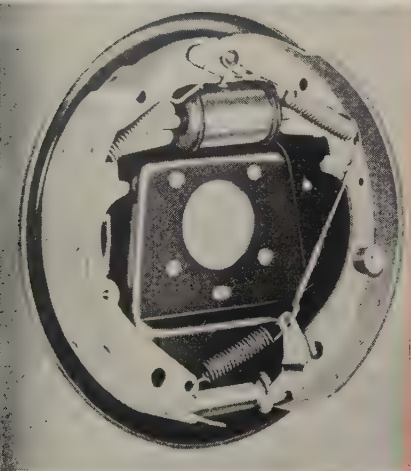

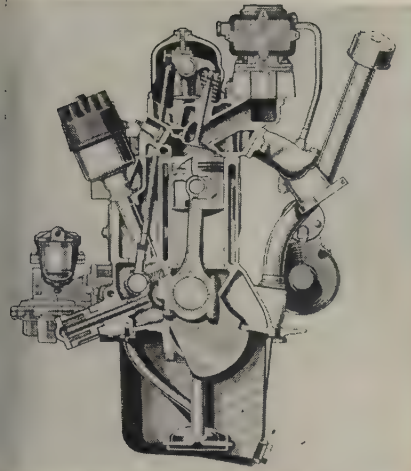

*Patent Applied for

Complete details about Amchem Granodraw processes are contained in Bulletin 1437. Write for your copy today.

GRANODRAW SS

GRANODRAW SS is another chemical development of Amchem Products, Inc. (Formerly American Chemical Paint Co.) Detroit, Mich. • St. Joseph, Mo. • AMBLER 27, PA. • Niles, Calif. • Windsor, Ont./Amchem and Granodraw SS are registered trademarks of Amchem Products, Inc.

These Are Design Highlights

ENGINES

- Aluminum Engine for Chevrolet
- Overhead Valves for Plymouth 6

TRANSMISSIONS

- Hydra-Matic Goes Slimline
- Transaxle Debut Delayed

BRAKES

- Ford Widens Drums
- Buick Stays with Aluminum

Detroit Readies 1960 Models

FEW CHANGES are expected in suspension systems and brakes for 1960, but significant improvements in transmissions and cooling systems will be seen at General Motors and Ford, says Detroit's rumor mill. Biggest news in the engine field is the Porsche type aluminum design that's scheduled for Chevrolet's light "H" car (see STEEL, Mar. 2, p. 87).

After nearly 20 years, Plymouth is reworking its 6 cylinder in-line powerplant for overhead valves. Aside from Chevy's light job and the Plymouth redesign, few changes

are anticipated in autodom's 1960 engine lineup.

No other aluminum engines are scheduled until the 1961 models although Chrysler may get its 6 cylinder diecast model underway late this summer. GM's Buick Div. supposedly has taken over production development on another V-8 aluminum powerplant, but it won't be ready before 1962. American Motors Corp. has sent an expediter to Germany to oversee production of dies for an aluminum diecast engine. It's believed this a Doehler-Jarvis job. Ramblers aren't likely

to see it before 1962. Ford's aluminum engine programs still are in the development stage. GM has built prototype engines for test.

• **Radiator**—One significant change expected in 1960 Ford Div. cars is a cross flow radiator. The top tank is mounted separately over the engine. The coolant runs sideways through the radiator core, still placed in front of the engine. Advantages: More efficient cooling and some height reduction.

• **Transmissions** — Contrary to popular reports, GM's Cadillac Div.

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

will not introduce a Transaxle in 1960. Neither will other GM divisions. The Transaxle is under development, but isn't expected until 1962 at the earliest.

One reason for the holdup is that GM still is developing a swing axle system to be used with the rear transmission setup. According to several sources, the corporation has not decided which type universal joint it will use for the Transaxle. With the present setup, GM uses a simple, hook type universal joint. The swing axle has more torque requiring a different type joint. Two commercially available units have been considered. One is the Bendix Weiss universal joint. The other is the Rzeppa joint, made by Gear Grinding Machine Co., Detroit.

• **Hydra-Matic Changed**—Chevrolet's light car will be using a revamped version of the Hydra-Matic transmission, say STEEL's sources. It's supposed to have three speeds forward—low gear, a 1:1 ratio, and overdrive. The larger Hydra-Matic cases are redesigned so the transmission can be mounted farther forward. This takes some bulk out of the passenger compartment and permits the floor pan to be flattened a few more inches. Both the conventional and light Hydra-Matic cases supposedly have special lugs for rear axle attachment.

Chrysler is reportedly readying a two stage version of its Power-Flite transmission, but this is not expected for 1960 introduction. It may be an option later when Chrysler's light car arrives. Chrysler will make its transmission and torque converter housings from aluminum next year. Reliable sources say that Ford transmissions are virtually unchanged.

• **Suspension**—Air suspension still hasn't caught on, but carbuilders will continue to offer it, primarily as a load leveling device, in 1960. Ford doesn't have air this year, but hopes to get a high pressure (1100 psi) system in operation in the fall. It will be used as a load leveler in conjunction with rear leaf springs. Chrysler has no intention of using anything but torsion bars through 1962, but will continue with air bags for load leveling.

Experimentation is continuing on

self-pumping and self-contained air springs.

Changes will be seen in ball joints after 1960. They're being coated with Teflon for long life without lubrication. Three versions are being tested by the Big Three and American Motors Corp. Tentative release is set for 1961. Next year, Cadillac's gas bag shock absorber will be optional equipment on Buick and Oldsmobile.

• **Wheels and Brakes** — Diecast aluminum wheels with integral brake drums and hubs have been considered for the Imperial. A permanent mold version has been proposed for Mercury. It appears neither of these will be released for 1960 production.

Buick's aluminum brake drum will continue next year. It's reported that Pontiac and Oldsmobile will make the aluminum drums available for police cars and taxis.

Ford Div. will widen its brake drums 1/2 in. to provide more surface, but the diameter will be unchanged. Self-adjusting brakes being used on Edsel and Mercury will be continued. Other divisions will stick with present brakes and wheels. The 13 in. wheels still are programmed for advance models, but they can't be used until more efficient drums and wheels are developed (see STEEL, July 7, 1958, p. 49).

• **Injectors Out**—Fuel injection obviously has fallen by the wayside as carbuilders continue with an economy kick. It allows efficient, therefore more economical, operation. But it still costs more than carbs. Thompson Ramo Wooldridge Inc.'s Thompson Products Div., Cleveland, reportedly is developing a system that interests GM. It's supposed to cost under \$50 in quantity production. Meanwhile, Chrysler is working with a supplier to injection mold a plastic carburetor.

• **Hydraulics** — Another Thompson Products offering is a hydraulic, constant speed drive programmed for 1960 Lincolns. It will power one or two accessories, possibly the air conditioning compressor and power steering pump. In time, it could be used for the generator, say engineers. This drive unit is considered by some industry men to be the first step toward a central hydraulic system, long standing dream of auto designers working on accessory components, such as power brakes and steering.

• **Electrical**—A flat, electric motor about the size of a king sized cigarette package, will be used to run radio aerials up and down on next year's Lincolns. This little package is expected to gain acceptance elsewhere for windows and seats.

While electronic ignition systems have been talked about in recent rumor columns, they will not appear in 1960 and probably won't be used before 1963.

Willys To Build Dauphine

Willys Motors Inc., Toledo, Ohio, will build Renault Dauphines in its Brazilian affiliate plant, Willys-Overland do Brasil. By the end of next year, the Sao Paulo facility expects its annual production rate to be 50,000 units.

Willys currently is producing 30,000 Jeep vehicles and Willys cars yearly at Sao Paulo, but it's expanding to produce these vehicles at a 100,000 annual rate.

Based on Renault's success in this country, it looks like Willys is making a smart move. Last year, Renault sent 22,439 cars to the U. S. This year, it shipped in 47,567 to keep second place in the import race, 30,000 behind Volkswagen.

*Week ended Feb. 28.

Construction Gives Economy Fillip

THE CONSTRUCTION industry is doing about everything expected of it as the perennial pace setter of the economy. It is setting records in the value of work put in place, and the high level of contracts coming in means that it will continue to do so throughout 1959.

• **Bucking the Weather** — Despite one of the most severe winters in recent years, construction activity has been at unusually high levels. During January, work put in place totaled \$3.657 billion, the highest figure on record for that month. February figures may not show up so well because of heavy snows and floods, but with an even break in the weather, this should be the best March in history.

The high level of contracts for future work during the last half of 1958 assured builders of brisk activity for early 1959. Contracts started to turn up from recession lows last May, which accounted for a corresponding rise in work put in place two to four months later. Now F. W. Dodge Corp., New York, reports that contracts in January continued to show strength. At \$2.3 billion, they were slightly above the December level and 12 per cent ahead of January, 1958, awards.

Engineering News-Record says that the cumulative total for future engineering construction for the

first two months of 1959 is 21 per cent ahead of the 1958 pace. Further evidence of a continuation of the uptrend is seen in the level of building permits in 217 major cities as reported by Dun & Bradstreet Inc. In January, the total was 8.8 per cent above the previous record dollar volume for that month.

• **Change in Emphasis**—The big reason builders are so optimistic is the firmness of the housing market. Nonfarm housing starts in January were the second best for that month, and the seasonally adjusted annual rate was nearly at the record level of 1955.

American Home Laundry Mfrs. Assn.

EN-R's February report is the fact that private construction awards are greater than public contracts for the first time in two years. "Pressure so far is coming chiefly from large scale home builders. . . . This sharply stepped-up rate of contracting should show up later this year in housing starts," it declares.

• **Signs of Life**—Observers feel that the construction picture for 1959—though good—will lack vitality unless it gets support from the industrial sector. They may have picked up a clue from last month's figures. Contracts moved 8 per cent above the January rate for industrial building and topped every month of 1958 except February, when four big powerplant additions swelled the total.

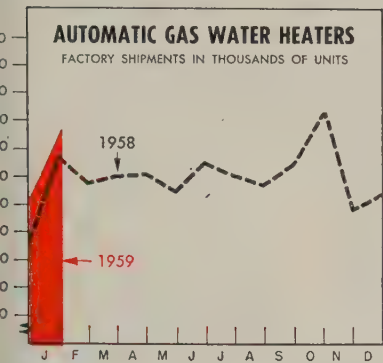

Some increased industrial activity is reflected in a 20 per cent increase in bookings for fabricated structural steel in January. The total of 235,784 tons topped the year-ago mark for the eighth consecutive month, although it was only slightly above the 1958 monthly average. Bookings exceeded shipments by 11,524 tons, says the American Institute of Steel Construction Inc., but cancellations forced a slight contraction in fabricators' total backlogs.

Shipments have been declining steadily since September, but a reversal in that trend is expected because of: 1. Better weather conditions. 2. An improvement in plant and equipment expenditure plans. 3. A possible acceleration of building schedules as a hedge against a probable steel strike and higher steel prices.

• **Real Improvement**—If the trends continue, and if the government's road building program progresses as planned, there should be no question of a dollar volume record close to \$53 billion for new construction put in place this year. Some of the \$4 billion increase over 1958's total will be accounted for by rising costs. (In the last year, building costs have gone up about 4 per cent.) But physical volume should increase by close to 3 per cent over 1958. This in turn will help boost both employment and personal income and keep the recovery on the beam.

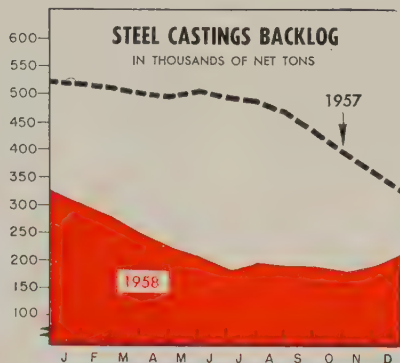

Index Pauses for George

STEEL's industrial production index was temporarily halted in its climb to a new peak during the week ended Feb. 28. Observance of Washington's birthday cut 2 points

from the postrecession high of 165 (1947-49=100) marked up in the previous week. Dips in output of electric power and freight carloadings completely outweighed continued gains in the steel and auto industries.

The steel industry is the driving force behind the current uptrend. Last week, steelmakers set a record of 2,535,000 net tons of steel for ingots and castings, beating the old mark set in December, 1956, by 10,000 tons. The operating rate was 89.5 per cent of capacity. Demand for steel products is continuing strong, which raises the question of how high output can go before the labor contract expires on June 30. Some observers point out that 5 to 10 per cent of the industry's capacity is marginal, or obsolete—equipment which would be pressed into service only in an emergency. Since this is no emergency, it looks like the top output could be about 2,690,000 tons, or 95 per cent of capacity.

Automakers are scheduling output of cars and trucks at the highest rate since mid-January now that Chrysler Corp. is back in full operation. Ward's Automotive Reports says producers are shooting for 2,218,000 units for the first half,

up 44 per cent from the first half of 1958. While this will put inventories in good position for an expected buying spurt in the spring, it also sets the stage for sharp cutbacks if sales fall flat.

Trends Fore and Aft

- Producers of gas appliances started off 1959 at a fast clip. They shipped 148,600 gas ranges in January, up 15.7 per cent from the corresponding 1958 period. Water heaters continue to set the pace, though. The industry shipped 254,300 units in January, higher than any monthly total of 1958 except October, reports the Gas Appliance Manufacturers Association.

- The American Home Laundry Manufacturers' Association reports its members also had a good January, topping year-ago shipments by 18 per cent. (See graph, Page 52.)

- Pennsylvania Railroad officials have approved building 11,500 freight cars at the road's Altoona, Pa., shops. Officials say this is the start of an extensive carbuilding program. Erie Railroad last week ordered 200 boxcars from Pullman-Standard Car Mfg. Co.

... every fastener need

Keep plant schedules on time

- Personalized Service
- Availability
- Fast Delivery

These three are Pittsburgh Screw and Bolt plus factors that can keep your plant humming on schedule. Our quality controlled fasteners meet every standard of performance—but most important, we offer service. Personalized attention to cut red tape. Consequently, back-up stocks of standards are immediately available to strengthen our distributor's supply. Keep us in mind for filling complete orders—fast!

Order from your nearest Pittsburgh Screw and Bolt distributor or send for our catalog today.

Try LINDE'S New "SIGMETTE" Torch!

-PORTABLE, COMPACT

Here's the torch that goes to the job—lets you work in any position . . . in confined spaces . . . at distance remote from the power source!

Designed for Sigma welding of light metals, the "Sigmette" torch is compact and sturdy. Notice the thin silhouette and position of the spool for complete visibility. Torch and control are completely insulated and grounded—the operator is protected from electrically "hot" parts. And the only maintenance tool needed is a screwdriver!

Find out how Linde's new "Sigmette" torch can speed your operations, bring new economies through its advanced design features. For a free demonstration and detailed information, mail the coupon today or call the nearest Linde Office.

Dept. ST-32, Linde Company
Division of Union Carbide Corporation

JOHN T. SCHANER
J. H. Williams p. a.

FRED DUFF
Morse Twist Drill v. p.

DONOVAN J. MURRAY
Mahoning Valley Steel pres.

J. HARRY REED
Youngstown Foundry v. p.

John T. Schaner was appointed purchasing agent, J. H. Williams & Co., Buffalo. He succeeds the late J. P. O'Brien. Frank J. Weber succeeds Mr. Schaner as assistant purchasing agent.

Fred Duff was elected vice president and sales manager, Morse Twist Drill & Machine Co., New Bedford, Mass., division of Van Norman Industries Inc.

James R. Brown was elected president, West Bend Aluminum Co., West Bend, Ind. He succeeds Albert C. Kieckhafer, elected to the new post of chairman.

R. David Mathias was made vice president-sales, L & J Press Corp., Elkhart, Ind. Robert H. Kemp was made chief engineer. He was with E. W. Bliss Co.

Max L. Hopkins was named Pacific Coast sales manager, San Francisco, for Wheeling Steel Corp.

W. T. Mitman was named to the new post of administrative manager of product sales for Aluminum Co. of America, Pittsburgh. He was product manager-sheet and plate sales, and is succeeded by Richard A. Sweet, former Cleveland district sales manager. H. T. Wilder fills the new post of commercial manager-product sales, and is succeeded by Albert H. Grosch as product manager-distributors, warehouses, and jobbers. James A. McGowan replaces Mr. Sweet at Cleveland. Robert J. Ogden was made manager-screw machine stock sales.

Donovan J. Murray was elected president, Mahoning Valley Steel Co., Niles, Ohio, an affiliate of General Electric Co. He succeeds John P. Hosack, retired. Mr. Murray was general manager of GE's Conduit Products Dept. at Bridgeport, Conn.

William C. Yocum was promoted from chief engineer to vice president-engineering, Superior Valve & Fittings Co., Pittsburgh.

Dwight W. Kaufmann was appointed manager of tool steel sales for Crucible Steel Co. of America, Pittsburgh. He succeeds A. H. Lewis, named assistant to the works manager of the Sanderson-Halcomb plant in Syracuse, N. Y.

Carpenter Steel Co. appointed David J. O'Neil Pacific regional manager (Pasadena, Calif.); William C. Kunkelman, midwestern regional manager (Cincinnati); Harold R. Potter, east-central regional manager (Bay Village, Ohio). Edward J. Barcal Jr. was made midwestern manager, Alloy Tube Div.

Lloyd P. Robertson, manager of the Conveyor Div., Logan Co., Louisville, was elected vice president.

Lloyd Leeseberg was made sales manager, Superior Foundry Inc., Cleveland, succeeding Warren W. Brown, resigned.

Howard B. Myers was named a vice president; Robert W. Romer, controller, Tenn-Tex Alloy & Chemical Corp., Houston, subsidiary of Tennessee Products & Chemical Corp.

J. Harry Reed, former sales manager, was named vice president-sales, Youngstown Foundry & Machine Co., Youngstown.

Kingsley C. Drone was made chief engineer, Aircraft & Missile Div., Clearing Machine Corp., Chicago. He was chief engineer of Hufford Corp.

William H. Hall was named manager of marketing for General Electric Co.'s newly organized rectifier components product section, Semiconductor Products Dept., Auburn, N. Y.

Robert J. Nixon was named to a management staff post at Racine, Wis., headquarters of J. I. Case Co. Pending full staff responsibilities in Racine, he is assigned the interim position of director of manufacturing, Harvesting Div. Mr. Nixon was president of Motor Products Corp., Detroit.

Charles Schaefer was made general sales manager, Permanent Filter Corp., Los Angeles. He was west coast branch general sales manager, S & S Machinery Co.

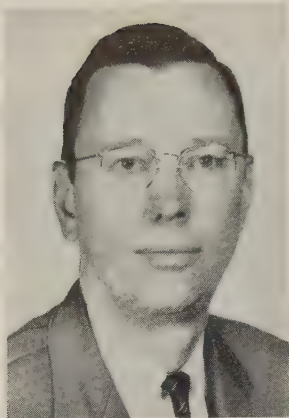

Henry S. Warren was made general sales manager, Sutorbilt Corp., Compton, Calif.

James W. Lewis joined Swanson-Erie Corp., Erie, Pa., as manager of sales engineering.

John D. Fansler was named general manager of Indiana Oil Equipment Co., Indianapolis. He handles all administrative and sales ac-

tivities. He was with Blackmer Pump Co.

Thomas A. Frischman, for the last 22 years chief metallurgist in the Axle Div., **Eaton Mfg. Co.**, Cleveland, was also made chief of quality control.

Albert L. Fairley Jr. was elected president, **Dominion Steel & Coal Corp. Ltd.**, Montreal, Que. Former executive vice president, he succeeds **Crawford Gordon Jr.**, now chairman. **Allan C. MacDonald** was elected vice chairman and chairman of the executive committee. Mr. Gordon is also president of the parent firm, **A. V. Roe Canada Ltd.**; Mr. MacDonald, executive vice president.

I. W. Gower was appointed director of research, **Botfield Refractories Co.**, Philadelphia. He was with the Research Dept. of **Mexico Refractories Co.**

Paul C. Diefenderfer, manager of the Escanaba, Mich., operations of **Harnischfeger Corp.**, was named to the new post of superintendent of excavators, Milwaukee.

Roy T. Omundson was elected a vice president, **Chemetron Corp.**, Chicago. He is president of the recently formed **Cardox Div.**

William H. Whyte was made sales manager, **Tin Plate Div.**, **Steel Co. of Canada Ltd.**, Hamilton, Ont.

Frank J. Scott, former industrial engineering executive for the Erie, Pa., plant of **Bucyrus-Erie Co.**, was named industrial engineer for **Bunting Brass & Bronze Co.**, Toledo, Ohio, a new staff position.

Walter F. Kaufman joined **Paulsen-Webber Cordage Corp.**'s Wire Rope Div., as vice president-manufacturing at the Sunbury, Pa., mill. He was chief rope engineer for **Wickwire Spencer Steel Div.**, Colorado Fuel & Iron Corp.

Dominion Bridge Co. Ltd., Montreal, Que., created four new regions, each controlled by a regional vice president operating from the Montreal head office. These appointments: **P. E. Savage**, eastern region; **Mackenzie McMurray**, Ontario region; **E. A. Ford**, central region; **R. J. A. Fricker**, western region. **Robert S. Eadie**, former vice president-manager of the eastern division, was appointed vice president and director of engineering, heading a newly created engineering services group. **George H. Midgley**, general sales manager, was named vice president and manager of the new marketing services group.

Evon Wells was made Philadelphia district sales manager, **International Resistance Co.**

E. R. Carey was promoted to assistant sales manager, regular products, **Dresser Mfg. Div.**, **Dresser Industries Inc.**, Bradford, Pa. He was manager-general markets sales, and is replaced by **John P. Lord**, former business manager for welding fittings.

Dean W. Paul, general sales manager, **Janette Electrical Mfg. Co.**, Morton Grove, Ill., was elected a vice president.

Harold G. Brown succeeds **H. E. Heywood** (retired) as manager, general sales office, **National Supply Co.**, Pittsburgh.

Theodore L. Kishbaugh was made general manager of the Wallingford, Conn., plant of **Joseph T. Ryerson & Son Inc.** He succeeds **Charles H. Hallett**, who resigned to establish a business in California.

T. P. Bronco was made assistant to the general manager-sales, **Page Steel & Wire Div.**, **American Chain & Cable Co. Inc.**, Monessen, Pa.

Charles Snyder was made general sales manager, **Stone Machinery Co. Inc.**, Manlius, N. Y.

B. K. Taylor was made St. Louis district manager, **U. S. Steel Supply Div.**, **U. S. Steel Corp.** He succeeds **Earl L. Simanek**, named Pittsburgh district manager for the division.

Jones & Laughlin Steel Corp. appointed **William F. Smith** chief chemist of the Aliquippa, Pa., Works, succeeding **D. J. Hallisey**, retired. **Milton Moses** was made assistant chief chemist.

Fred G. Outcalt was made sales manager, **Linde Dept.**, **Union Carbide International Co.**, division of **Union Carbide Corp.**, New York. **Dr. G. H. Wagner** was made director of research.

H. J. Siekmann was promoted to manager, market development and research, **Metallurgical Products Dept.**, Detroit, **General Electric Co.**

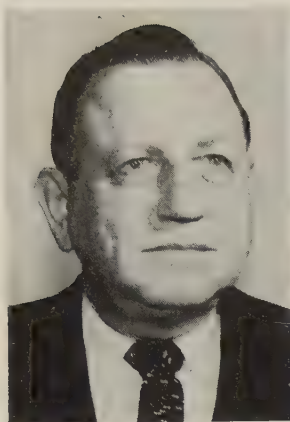

Walter E. Stewart was appointed product engineering director, **American Welding & Mfg. Co.**, Warren, Ohio.

Wayne O. Vinson was appointed general purchasing agent, **American Laundry Machinery Co.**, Cincinnati.

nati, succeeding John B. Patzold, retired.

Dr. Charles E. Reed was named general manager of General Electric Co.'s Metallurgical Products Dept., Detroit. He succeeds **Kenneth R. Beardslee**, who becomes a consultant for the department. Dr. Reed was general manager, Silicone Products Dept., Waterford, N. Y., and is succeeded by **Jerome T. Coe**.

Val Heidenreich was appointed office manager, New York district sales office, Allegheny Ludlum Steel Corp.

Philip G. Renie fills the new post of staff manager of the Factory Engineering Dept., Martin Steel Corp., Mansfield, Ohio.

Earl K. Schafer was made market research manager; **Fred J. DeBruzzi**, assistant to the sales manager, Bearing Div., Valparaiso, Ind., McGill Mfg. Co.

Louis C. Colleran was elected vice president-sales, Roll Formed Products Co., Youngstown.

Lawrence H. Hodges was made manager, Rockford, Ill., Works, J. I. Case Co. He was chief product engineer of the works.

Charles C. Libby, former manager, Electrical Dept., Fair Lawn, N. J., branch of Fairbanks, Morse & Co., was appointed manager of the Electrical Div. Now in the sales division headquarters at Freeport, Ill., he replaces **W. H. Kingsley**, resigned.

Becco Chemical Div., Buffalo, Food Machinery & Chemical Corp., promoted **Harlow G. Hyatt** to production co-ordinator for its two plants, Buffalo and Vancouver, Wash.; **Bartlett B. Wright** to production manager, Buffalo plant; **Roger L. Sullivan** to production superintendent in Buffalo.

R. D. Werner Co. Inc., New York, appointed **William B. Caldwell Jr.** manager of its Chromtrim Metal Moulding Div.; **G. Patrick Bingham**, product manager, Sink Frame Div.

C. E. Ponkey was named president of Layne & Bowler Inc., Memphis, Tenn., to succeed **W. H. Reeves**, who continues with the company in a consulting capacity as a vice president. Mr. Ponkey was executive vice president. Other appointments: **J. G. Gordon III**, vice president; **F. T. Quinn**, vice president-manufacturing.

Donald W. Oakley was made general manager of Metal & Thermit Corp.'s newly integrated Coatings Div. Assisting him are: **D. R. Meserve**, sales manager; **F. L. Scott**, technical manager; **A. S. Pollock**, plant manager.

Donald A. MacRitchie, former vice president - general manager, was elected president of Artisan Metal Works Co., Cleveland.

OBITUARIES...

Leo A. Behrendt, 62, vice president, Joseph Dixon Crucible Co., Jersey City, N. J., died Feb. 11.

Daniel H. Haynes, 77, a vice chairman, American Machine & Foundry Co., New York, died Feb. 28.

Henry B. Austin, 61, vice president, Armstrong Bros. Tool Co., Chicago, died Feb. 26.

Albert J. Dempsey, 65, vice president, Crucible Steel Castings Co., Milwaukee, died Feb. 25.

Stewart C. Hagen, 41, a buyer in the purchasing department of Falk Corp., Milwaukee, died Feb. 18.

William E. Zipp, 58, vice president, Ceco Steel Co., Cicero, Ill., died Feb. 21.

William I. Jones, 63, general manager of General American Transportation Co.'s plant in East Chicago, Ind., died Feb. 20.

Loren L. Heberd, 71, chief engineer, Ramtite Co., division of S. Obermayer Co., Chicago, died Feb. 19.

Durban Longenecker, 59, former president, Toledo Pipe Threading Machine Co., Toledo, Ohio, died Feb. 16.

Robert W. Goetz, 62, purchasing agent, Enos & Sanderson Co., Buffalo, died Feb. 20.

Bennett Mining Changes Hands

Pittsburgh Steel gains control; expansion of pellet capacity is planned by Humboldt firm

TWO NOTEWORTHY events have occurred on the iron ore front:

Pittsburgh Steel Co., Pittsburgh, gained control of Bennett Mining Co., Hibbing, Minn.

Humboldt Mining Co., Humboldt, Mich., announced plans to double its pellet capacity.

Pittsburgh Steel acquired a 78 per cent interest in Bennett by buying the holdings of Bethlehem Steel Corp., Bethlehem, Pa., and Youngstown Sheet & Tube Co., Youngstown. Interlake Iron Co., Cleveland, retains the balance. Pickands Mather & Co., Cleveland, will operate the property.

The purchase, to be paid over a four year period, will enable Pittsburgh Steel to obtain 40 per cent of its ore requirements from its own mines.

Included in the property is a three year old beneficiating plant capable of producing coarse or fine grades.

Humboldt Mining will double its capacity to make iron ore pellets to about 640,000 tons annually with the addition of a 2000 ton per day plant. Arthur G. McKee & Co., Cleveland, has been retained to build it.

Scheduled for completion by mid-1960, the plant will make commercial use of the grate kiln process in producing pellets from concentrates containing over 60 per cent iron. The pellets can be charged directly into the blast furnace without additional processing.

The Humboldt properties are operated by Cleveland-Cliffs Iron Co., Cleveland, joint owner with Ford Motor Co.

Brick Capacity Increased

Kaiser Chemicals Div., Kaiser Aluminum & Chemical Corp., Oakland, Calif., is expanding the basic refractory brick capacity at its Columbiana, Ohio, plant for the second time in three years. Purpose: To

meet increased demands for the division's products, particularly those for all basic, open hearths.

When completed late this year, the Columbiana facility and Kaiser's Moss Landing, Calif., plant will have a combined annual capacity of 200,000 tons of basic refractory brick and mixes.

Talco Gets Catapult Jobs

Two contracts (worth over \$500,000) for the development and production of rocket catapults for aircraft emergency escape systems have been awarded Talco Engineering Co., Mesa, Ariz., a Gabriel Co., Cleveland, subsidiary.

One catapult is for the B-70 and the F-108 under development by North American Aviation Co., Los Angeles. The second is for use with newer versions of the B-58 being delivered to the Air Force by Convair, Ft. Worth, Tex.

Techline Opens New Lab

Techline Div., Wheelabrator Corp., Vicksburg, Mich., opened a new chemical laboratory for research and development on barrel finishing compounds.

Kollsman Motor Formed

Standard Coil Products Co. Inc., Melrose Park, Ill., has formed Kollsman Motor Corp., a wholly owned subsidiary. Kollsman will design and manufacture special purpose precision electric motors.

New Penn Machine Division

Penn Machine Co., Johnstown, Pa., established an Industrial Div. to produce gears and other machined metal parts for general industry. Penn Machine will continue to make gears and other replacement parts for the mining industries.

Porter To Make Moldings

H. K. Porter Company, Inc., Pittsburgh, has organized a Mouldings Div. to manufacture the complete line of automotive and other metal moldings formerly produced by Herron-Zimmers Moulding Co. Porter recently purchased the Herron-Zimmers plants at Detroit and Frankfort, Ky.

Kennecott Expands

Kennecott Copper Corp., New York, plans to spend \$90 million for expansion and modernization this year. It is part of a \$172 million program initiated last year.

Circo Ultrasonics Formed

Circo Ultrasonic Corp., Clark, N. J., has been formed by Circo Equipment Co., cleaning equipment manufacturer. The new corporation will make ultrasonic cleaning devices.

AMF Changes UK Name

American Machine & Foundry Co., New York, has changed the name of its United Kingdom subsidiary from Industrial Machinery Co. Ltd. to AMF Ltd. George M. R. Lord is general manager.

CONSOLIDATIONS

Howell Electric Motors Co., Howell, Mich., has acquired Ohio Electric Mfg. Co., Cleveland, and its wholly owned subsidiary, Kingston-Conley Inc., Plainfield, N. J. The new corporation will operate under the Howell name, but Ohio and Kingston-Conley trademarks will be retained.

The firm produces industrial, gear, elevator, fractional horsepower, punch press, and special design motors, bench grinders, lifting and separation magnets, and magnet control equipment.

Erie Meter Systems Inc., purchased last year by A. O. Smith Corp., Milwaukee, will be merged with the parent company. It will become part of the new Smith-Erie Div. which includes the meter and service station pump divisions at Los Angeles. The Erie, Pa., plant and its personnel will continue without change.

Eastern Malleable Iron Co., Naugatuck, Conn., has purchased Danforth Anchors, Berkeley, Calif.

YEARS OF PROFITABLE PRODUCTION

BUILT INTO

"BUFFALO"

NO. 18 DRILLING MACHINES

These drills are constructed to provide the longest possible useful life and the utmost accuracy in operation. Easy to set up and operate, the rugged, dependable No. 18 is designed to cut production costs in a wide variety of operations.

Quality Features of the "Buffalo" No. 18 Drill:

- **SPINDLE** — Multiple-splined alloy steel, ground, polished and carefully balanced. Rotates in two precision-type ball bearings, designed to take the thrust of heavy-duty operations. Design of spindle pulley bearings prevents torque being transmitted directly to spindle.

- **FRAME** — Large, heavy head frame insures accuracy throughout life of machine.

- **TABLES AND BASES** — Built to extra-heavy proportions, with large working surfaces.

- **RAISING SCREW** — Full ball bearing construction, actuated by machine-cut steel screw and gears. Three ball thrust bearings provide easy operation.

- **FOOT FEED** — Operated by a gear meshing the feed pinion. Foot treadle return by torsion spring, giving maximum return pressure at end of stroke.

For capacities up to 1" in cast iron, the "Buffalo" No. 18 Drill is your best buy. Available in floor and bench models — bench types up to 6 spindles.

Contact your "Buffalo" machine tool dealer for full information on the No. 18 Drill, or write us direct for Bulletin 3123-E.

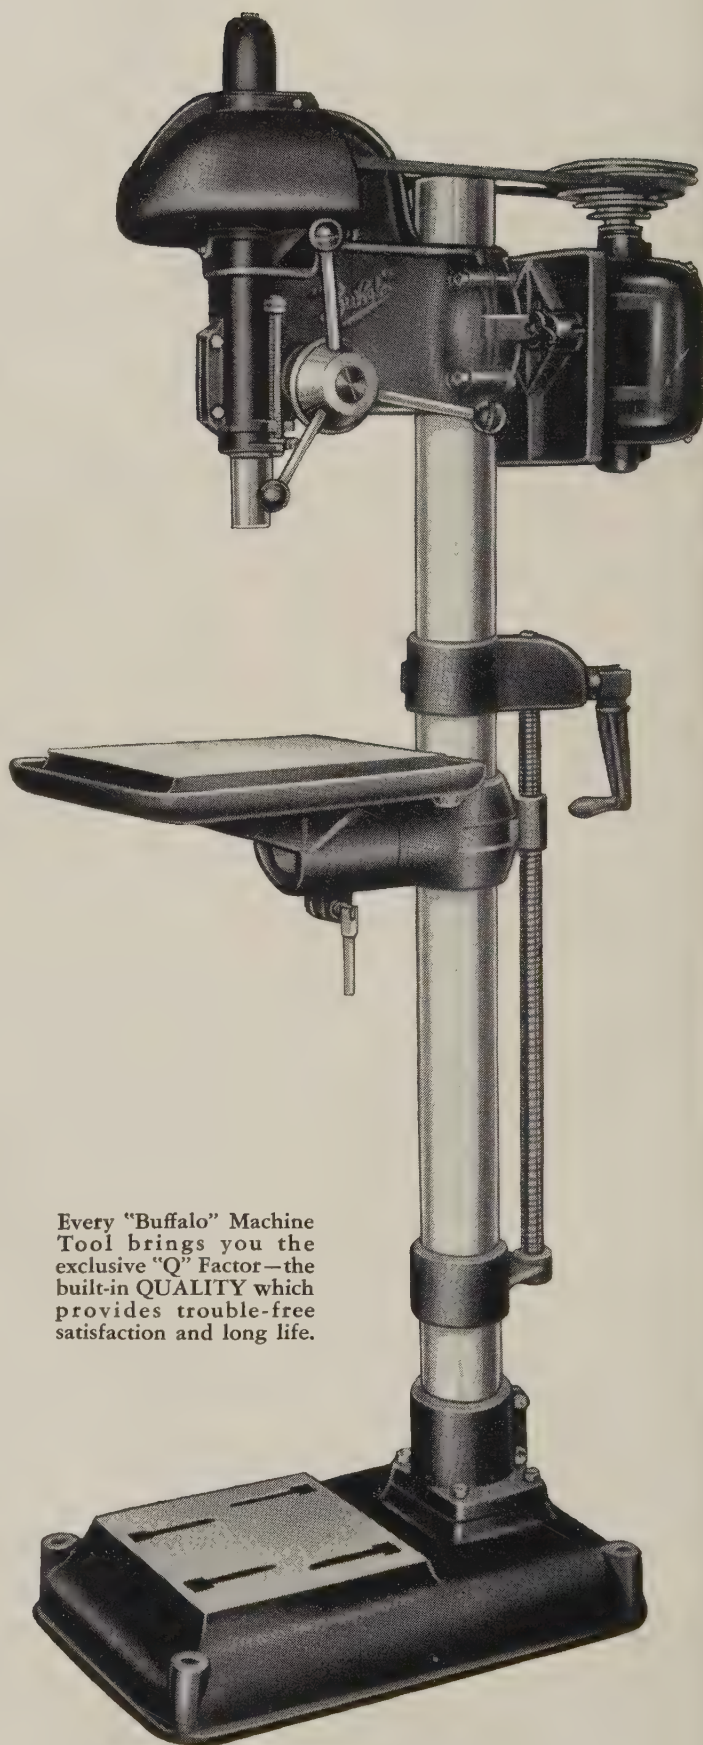

BUFFALO FORGE COMPANY

Canadian Blower & Forge Co., Ltd., Kitchener, Ont.

DRILLING PUNCHING SHEARING BENDING

Every "Buffalo" Machine Tool brings you the exclusive "Q" Factor—the built-in QUALITY which provides trouble-free satisfaction and long life.

Technical Outlook

March 9, 1959

REBUILDS WAYS—A single application of an epoxy resin is adequate for building up worn ways and tailstocks when only a few mils of thickness are needed, says Larry Fagin, Frost Rebuilding Co., Los Angeles. Some compositions contain graphite as a built-in lubricant. Lathes, planers, and milling machines can be rebuilt higher than 4 mils with a Micarta filler.

MORE ALUMINUM CANS—The Navy is using deep drawn aluminum cans (quart size) to store synthetic lubricating oil for jets, says Kaiser Aluminum & Chemical Corp., Oakland, Calif. They weigh two-thirds less than conventional containers, and side seams and bottom double seams are eliminated, a feature which lessens the possibility of contamination. Bottoms fit over tops to save shipping space.

REVISE TWIST DRILL STANDARD—The American standard for twist drills (B5.12) has been revised by the American Standards Association, New York. Additions: Combination drills and countersinks; selected sizes of millimeter drills; screw machine length drills; and an appendix listing drills by decimal sizes. Changes: Drill names (to eliminate confusion). Deletions: Automotive drills. Copies (\$2) can be obtained from the standards society or the American Society of Mechanical Engineers, New York.

TEXTURE-TONE STEEL—A new kind of steel combines a plated reflective surface, a variety of textures, and a hard, transparent coating. The result is a novel metallic appearance like anodized aluminum, says Ardmore Products Inc., Roselle, N. J. Cost: 12 cents a square foot.

DIECASTING COMPETITOR—Parts made from Du Pont's new plastic, Delrin, are expected to compete with their aluminum, zinc, or brass counterparts. In trials, auto engine components made of the material lasted the life of the car. Properties: The plastic is similar to metal—dense and highly crystalline; its tensile strength is 10,000 psi at room temperature (it gets stronger

at low temperatures; operating ceiling is 250° F); its melting point is 347° F; and it's light. Say the Delrin part weighs 2 ounces. Here's the weight of comparable parts made with metals: Aluminum, 3.7 ounces; zinc, 9.3 ounces; brass, 12.3 ounces. Although raw material cost is higher than that of metals (95 cents per pound in truck loads), savings come through elimination of machining, says Du Pont.

BETTER MAGNET METAL—An alloy of cobalt and platinum is said to have remarkable physical and magnetic properties (residual magnetism 6400 gauss; coercive force, 4800 oersteds). Heat treatment is necessary, and it has similar properties in all planes. The alloy is comparatively workable before heat treatment. Main uses: Magnets with extremely small or complex shapes. It's made by Johnson, Matthey & Co. Ltd., London, says *Welding & Metal Fabrication*, London.

ZIRCONIUM CORROSION RATING—Fifteen months of corrosion testing in 145 types of environments have shown that zirconium really demonstrates its benefits in dry chlorine, strong alkalis, and conditions that alternate between strong acids and strong alkalis. The tests covered 2300 specimens of some 40 corrosion resistant metals. The testing firm, Columbia-National Corp., Cambridge, Mass., will report its results next week at a Chicago meeting of the National Association of Corrosion Engineers.

ELECTRON BEAM WELDING GAINS—

Commercial versions of vacuum furnaces which apply the electron beam principle to single production jobs are beginning to appear. Air Reduction Sales Co., New York, announced its first version. The British (Edwards High Vacuum Ltd., London) also have one that is similar. Advantages: Weld metal is purer than base metal; since the device operates in a vacuum, it joins sensitive metals like molybdenum and titanium without danger of contamination; weld contours are exceptionally smooth, an added feature where stress concentrations are involved.

Interior view of unsteady state arc furnace showing a casting produced

Reactive Metal Melting Furnace Eliminates Water Cooling Hazard

A heavy skull maintained in the crucible acts as a heat sink to handle the heat generated during melting. It eliminates costly and complicated cooling systems

A NEW CONCEPT in vacuum arc, skull melting may bring down the cost of processing highly reactive metals and eliminate a hazardous condition.

It combines a rapid melting cycle with a heavy skull and crucible to handle the heat transferred dur-

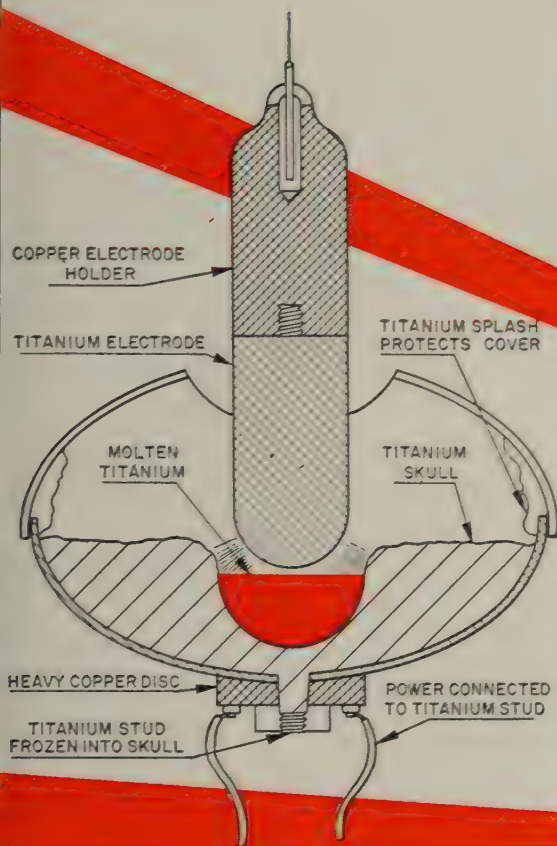

ing melting. Costly and complicated cooling systems are not needed; there is no danger of water-reactive metal explosions.

- **Conventional Method**—The vacuum arc skull furnace has been widely used for melting and shape

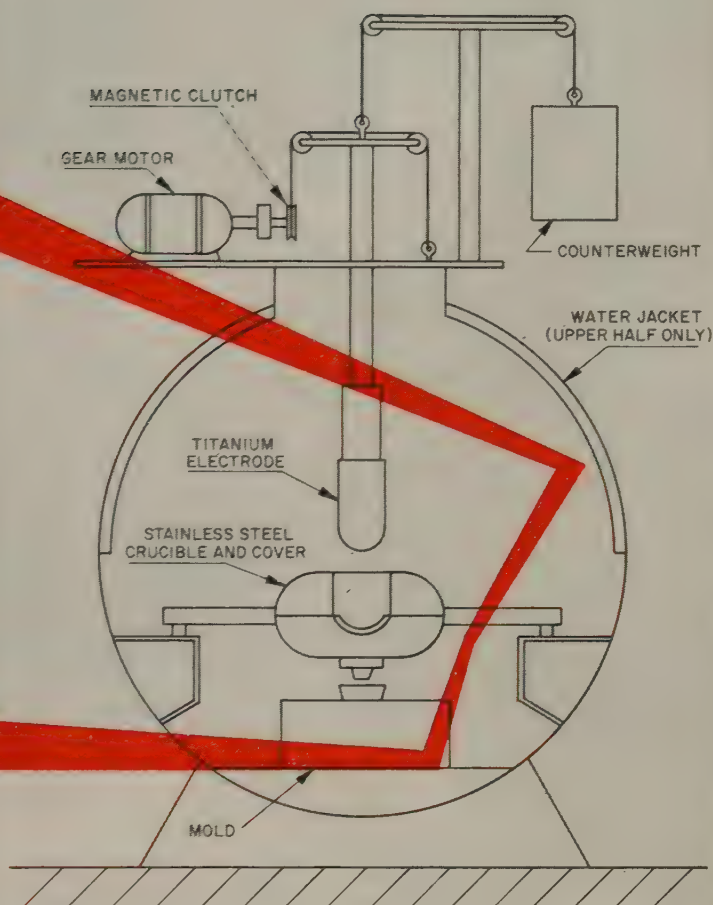

By M. L. TORTI
Project Manager
and

JOHN L. HAM
Research Associate
National Research Corp.
Cambridge, Mass.

casting reactive metals. Melting is done with a high current electric arc that is struck between the metal in the crucible and a consumable electrode of the same metal. The crucible is generally copper, cooled by copper water coils brazed to the crucible, or by a water jacket.

Drawing of unsteady state arc furnace (right) shows position of mold and method of lowering and raising consumable electrode. Above: Cross section of crucible and electrode. Titanium skull remains in crucible, acts as a heat sink. Water cooling of crucible isn't necessary

When sufficiently high power is used, all the consumable electrode and the scrap in the crucible melt; the entire charge is then poured. While the procedure gives good results, there is always the danger of a water leak which may be disastrous if a large volume of metal is molten. As a precaution, melters have used remote controls and barricades, with carefully designed crucibles and cooling systems.

• **New Concept**—Since roughly 1 lb of titanium can be melted per minute per 1000 amperes, a 50 lb melt can be completed in 5 minutes using 10,000 amperes. Thus, the short cycle time and the generally low thermal conductivity of the reactive metals make it possible to use an unsteady state (or heat sink) concept for the crucible to eliminate water cooling.

In a prototype of the new fur-

nace, the crucible is a shallow, stainless steel bowl, $\frac{3}{4}$ in. thick, 8 in. deep, and 22 in. in diameter. Its interior is sprayed with alumina. A good electrical ground is assured by a heavy titanium stud which extends from the skull through a hole in the crucible to the electrical connections. A stainless steel cover was used.

• **Cooling** — The furnace tank is double walled. Water cooling is restricted to the area above the level of molten metal in the crucible. The electrode holder is a solid piece of copper, forged to a 4 in. diameter lower section and a 2 in. diameter neck about 4 ft long. Water circulates through a hole drilled the entire length of the holder. The water is separated from the liquid metal by several inches of solid copper, and no brazed or welded joints are used.

The electrode is positioned by a variable speed, direct current drive. The rapid retraction necessary for quick pouring is obtained by releasing a magnetic clutch, which allows the heavily counterweighted electrode to retract rapidly.

• **Permanent Skull**—The prototype furnace has been used for a campaign of about fifty 20 lb titanium alloy castings with no attention to the skull except for an occasional clearing of the pouring lip. The skull is a titanium alloy containing 6 per cent aluminum and 4 per cent vanadium. It weighs about 250 lb.

Melting was done with a 3 or 4 in. diameter titanium electrode of the same composition as the skull, carrying 8000 amperes for 2 to 3 minutes. Furnace pressure was kept below 5 microns. About 5 lb of scrap was put into the bottom of

the crucible to be melted and poured with the virgin metal.

The 20 lb pours used for the testing programs do not seem to approach the limit for the unit. Adequate superheat was obtained for complete filling of intricate shapes using expendable graphite molds. The interior of the empty skull was essentially hemispherical, indicating that the crucible could be deeper and smaller in diameter.

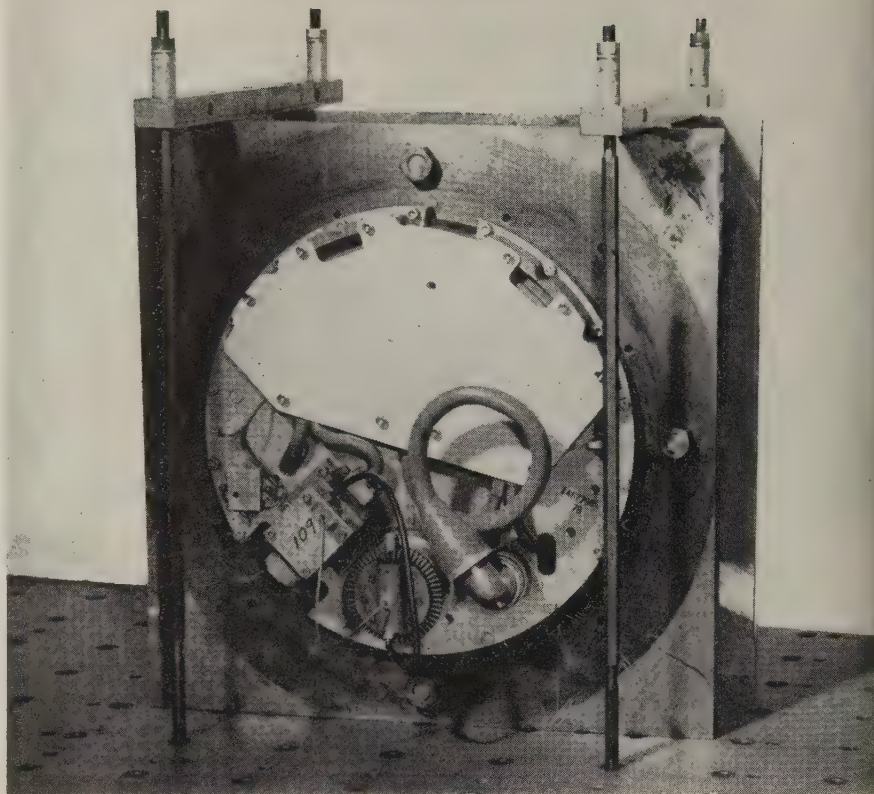

• **Heat in Crucible**—Temperature at several positions of the stainless crucible was recorded continuously during and after melting and pouring. Less than 20° F rise was recorded during the melting cycle, but after the pour the temperature of the surface continued to rise for about an hour until the skull and crucible reached thermal equilibrium at 200 to 300° F. After that, the crucible cooled slowly by radiation and conduction. The thick skull eliminated any possibility of contamination from the crucible.

The unsteady state concept of melting could easily be applied to a semicontinuous production operation. Several pours can be made without opening the furnace if mold locks or a rotating mold table are installed. Considering the small temperature rise, at least four to six pours could be made in rapid succession before the crucible begins to heat excessively.

• **Production Work**—If continuous operation is desired, an auxiliary cooling unit could be attached to the crucible. If power is removed after melting (it takes about 5 minutes to melt the charge and electrode) and is left off for 30 minutes to an hour, then a cooling unit with considerably lower cooling capacity than a water system could maintain the crucible at a safe temperature.

Air or inert gas circulated through tubing attached to the crucible would have sufficient heat removal capacity. In any case, it would not be necessary to use water.

The requirements for the unsteady state crucible are much less stringent than for either a water or radiation-cooled crucible. Cast iron should be quite satisfactory, since neither exceptionally high temperature strength nor high thermal conductivity is required.

Depth bomb subassemblies, with nylon-locked fasteners, underwent punishing tests

Nylon Locked Fasteners Pass Test

They may serve you as well as Navy, which has chosen them for new depth bomb. In everyday applications, they can be removed and re-used without loss of locking action

RELIABLE threaded fasteners are a must if you have to disassemble equipment frequently for inspection, then reassemble it.

A type of male threaded fastener, with a small nylon pellet embedded in the threads to provide locking action, has been chosen for use in a new, aircraft-launched depth bomb.

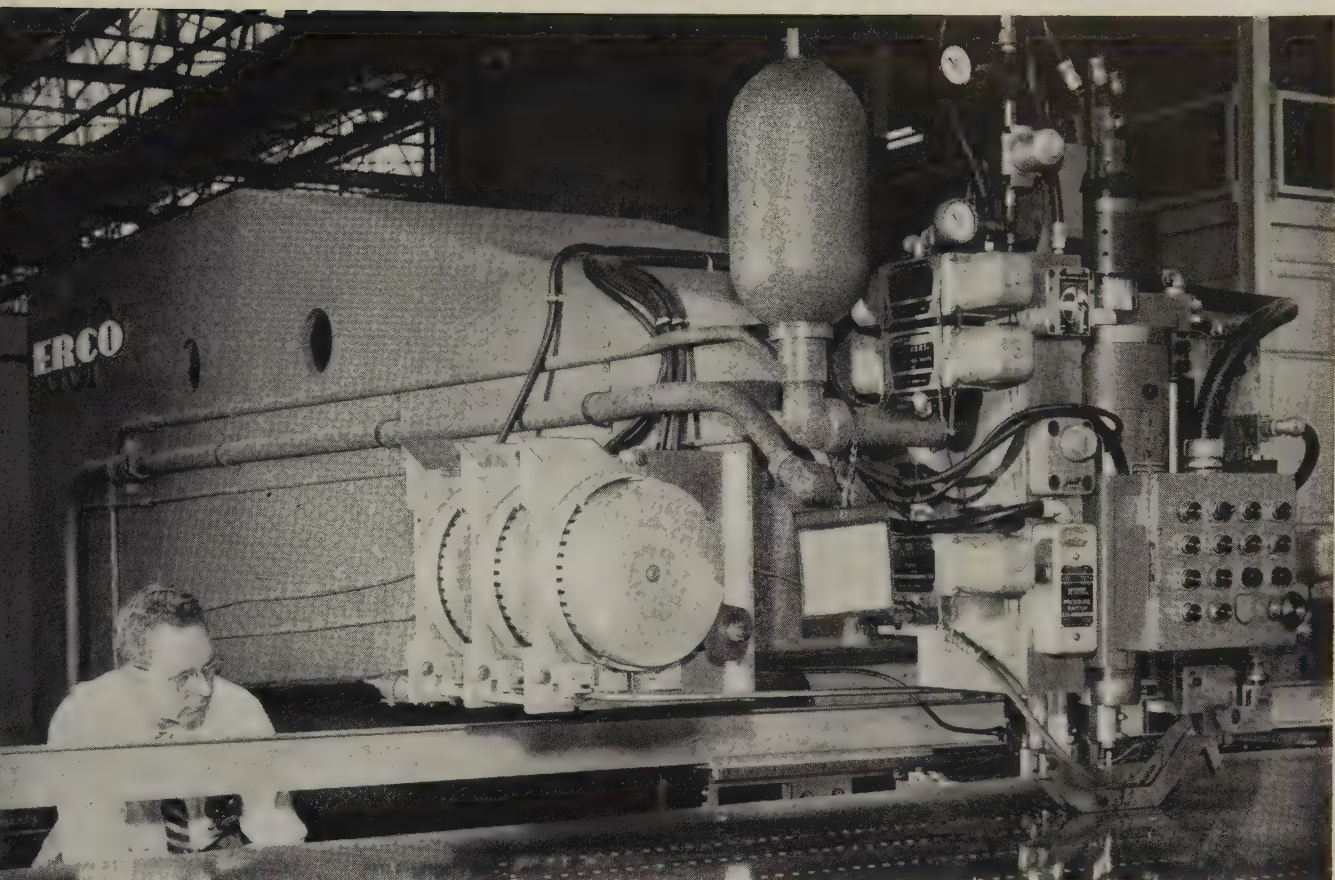

The fastener has undergone two years of exhaustive testing at Naval Ordnance Laboratory, White Oak, Md. The tests, under the direction of Daniel Finelli, mechanical engineer at the laboratory, will assure weapon reliability.

• **Passes Tests**—None of the nylon-plugged screws failed in tests to pre-

established standards set up by engineers. They are re-usable, with no significant loss of locking action.

Before they were approved for use in the antisub weapon, the screws withstood water entry tests, in which assembled depth bombs were dropped from aircraft, hitting the water at 500 to 2000 Gs.

The fasteners endured 240 hours of flight, in which they were subjected to extreme vibration. There was no loss of locking action after 15 removals, with 24 hours of vibration after each removal. The fasteners withstood 78 hours of vibration in which the temperature was varied from -65 to 165° F; they didn't fail in three separate, 1084 hour vibration tests.

As the tapered wing skin travels through the machine, the correct length rivet is picked from one of three hoppers (center), inserted in the readied hole, headed, and shaved

Riveters Speed Jet Assembly

Automatic machines do seven fastening jobs at Convair. They can pick rivets of the proper length from three hoppers. The hand finishing job is eliminated

THREE automatic riveting machines are being used in the assembly of jet airliners (the 880 and 600) at Convair, a division of General Dynamics Corp., San Diego, Calif.

The machines were developed to Convair specifications by the Nuclear Products-Erco Div., ACF Industries Inc., Riverdale, Md.

A. E. Hill, works manager at Convair's plant No. 1, says the riveters are designed to do a complete job on wing and fuselage skins and stringer panels with no loss of speed. Hand finishing is eliminated.

The three machines work on wing panels; a fourth (now being in-

stalled) will process fuselage panels. Cost of the machines, associated tooling, and controls is \$442,896.

• **Job**—The machines will:

1. Clamp a stringer to the aluminum alloy skin panel with 500 psi pressure.
2. Drill and countersink the holes.
3. Insert the rivet.
4. Head the rivet with a 15,000 lb squeeze.
5. Shave the rivet head.
6. Unclamp and air blast chips away from the work area.
7. Move the skin and panel to the next rivet location.

These steps overlap; shaving the

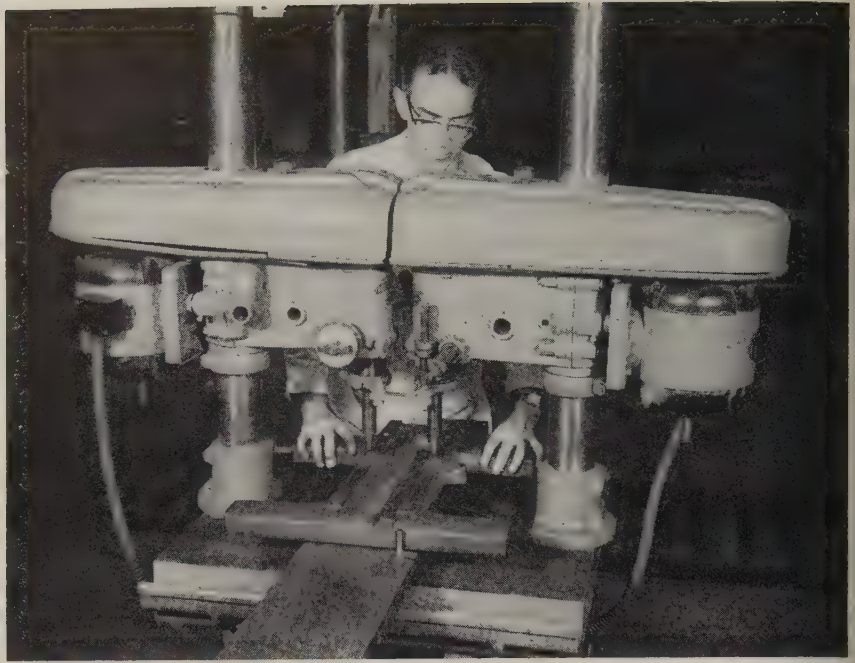

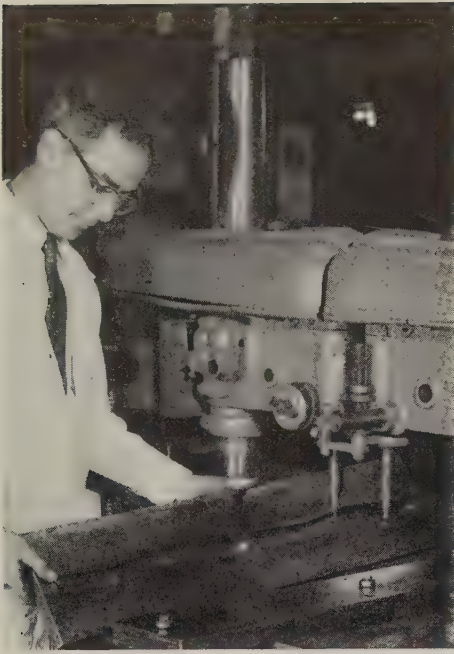

rivet head flush with the skin takes no extra cycle time.

• **Production**—At a rivet spacing of 1 in., and with a thickness of $\frac{3}{8}$ in., the machines operate at 12 rivets per minute.

A template at the side of the machine helps locate rivet positions. The machines select the proper length rivet from one of three hoppers.

Panels are assembled in stationary fixtures where Scotchweld adhesive film also is applied. Stringers are held in place with tack rivets. Then the panels are placed in the holding fixtures which operate on the worktable designed for use with the machines.

Convair uses a special Straylor rivet for wings to make a metal-to-metal seal. It's necessary because the wings double as fuel tanks.

Two drill presses face each other across a single table. They are tooled to rout the lubricant grooves in the part. Pattern of the grooves is generated by a milled slot in the fixture (at left) that follows a set of roller guides

Two caster-mounted drill presses, one vertical and the other horizontal, drill dowel and mounting holes in machine table sections

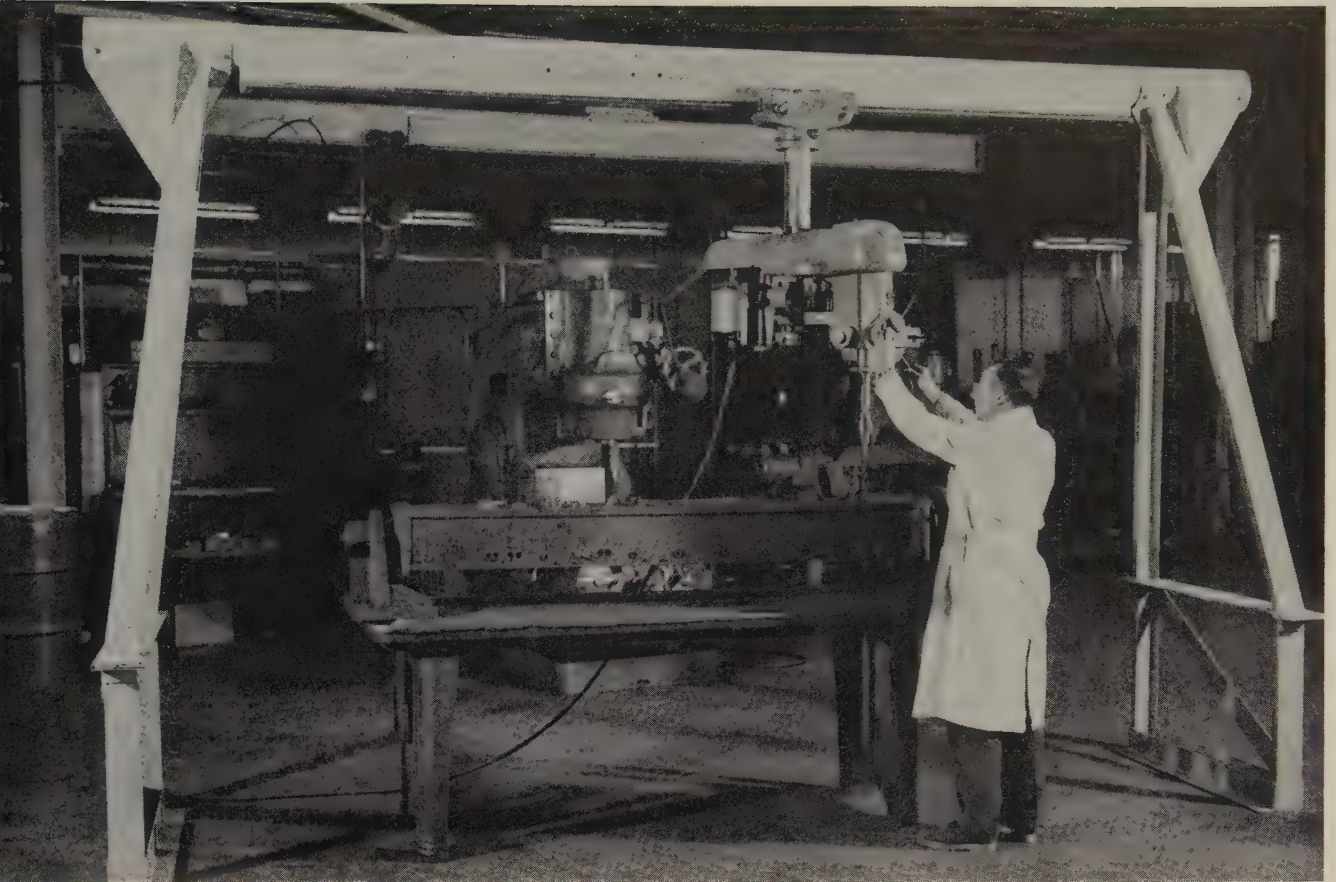

You Can Get Extra Mileage Out of Your Drill Presses

That's the advice of a machine builder who has come up with a variety of applications in his plant. He also uses the tools for work ordinarily reserved for other machines

PRODUCTION men at the Bellefontaine Div., Rockwell Mfg. Co., Bellefontaine, Ohio, have more than a passing interest in drill presses. They make them and also use them.

They feel that they've proved a point: A drill press can be one of metalworking's most versatile manufacturing tools.

In addition to standard work, including drilling, reaming, tapping, and spot-facing, the division's machines have been tooled to grind,

Operator uses a suspended machine to drill a lathe table. The span permits the spindle to reach the middle of large panels or assemblies

This ten-spindle drill press lets an operator complete a series of operations in one setup. Four heads (two at each end) have power feeds, so an operator can start the cycle then work at another machine on a separate operation

polish, mill, rout, and do other jobs normally left for special units.

Groove Milling — For example, fabricant grooves are cut in a machine component. The job is done by two drill presses that face each other across a single table. The distance between the spindles is equal to the distance between grooves on the finished part.

A two-piece jig guides the part under the routing cutters. The bot-

tom part of the jig, bolted to the worktable, has two guide rollers in its center. The top half of the jig has a milled slot that's the same shape as the grooves to be machined in the part. The slot in the jig rides the rollers, providing the contour travel for the part.

- **Portability**—John H. Diehl, Bellefontaine Div.'s general manager, says you can add a great degree of versatility to the machines by sim-

ply making them portable. "A number of our machines," he says, "are mounted on casters so they can be moved into place as needed."

Case in point: Two portable drill presses cut dowel and mounting holes used to join worktable sections. The tables (for multiple-spindle drill setups) are assembled and drilled to customer specifications. With portable drill presses, the whole job is done in one setup.

One machine is mounted hori-

zontally on a platform that rides on casters. It drills dowel holes in table edges. The operator rolls it up to the conveyor that holds the workpieces. Two brackets are dropped in place; they hold the press steady during drilling.

The other machine drills vertical mounting holes. It is also mounted on casters. Its column is offset so it will reach over the work, and the table is positioned under the conveyor table to give adequate support during drilling. The platform is weighted to counterbalance the load of the drill press when it is extended over the work.

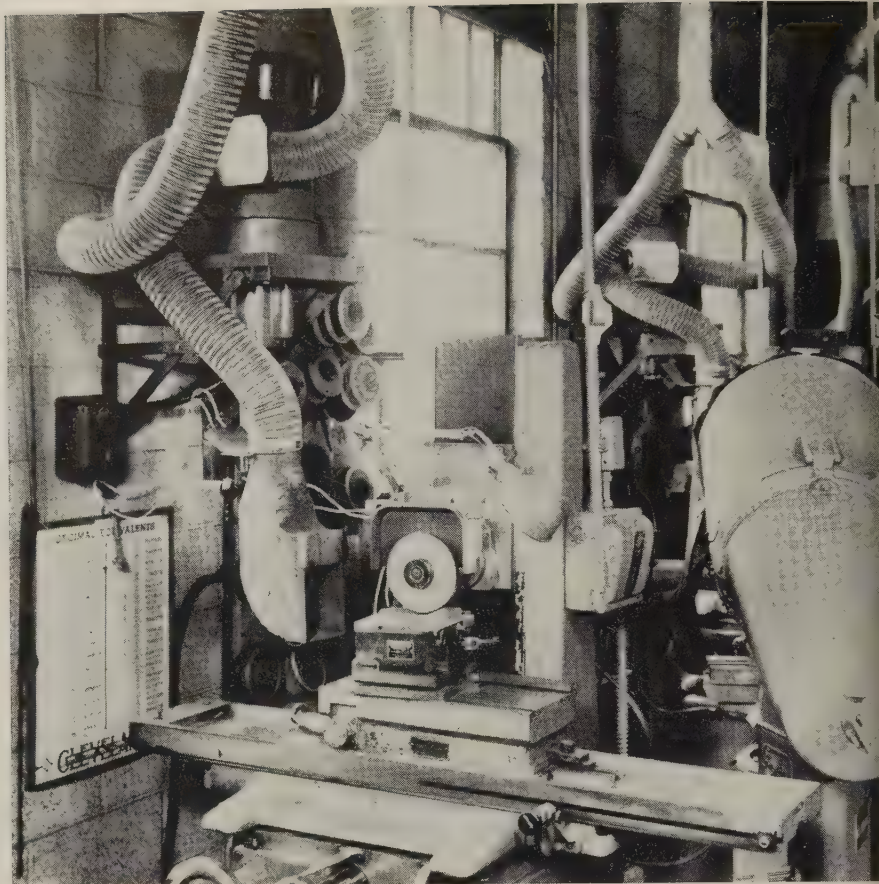

Mr. Diehl cites another example where four drill presses (mounted in pairs) are set up near an automatic milling machine. The operator puts one part in the milling machine and starts the cycle. Then, while the milling machine goes ahead with its work, he uses the drill presses to drill and tap four holes in a milled part. Instead of doing one job, the operator is completing nine.

• **Machine Team**—Mr. Diehl says: "The simplest setup we have for getting drill press versatility is a ten spindle, one table machine on which we drill several hundred different parts that are produced in quantities too small to justify a permanent setup." The setup has standard machine heads and table sections.

Two or three operators work at the machine, passing the work from one spindle to the next. The work can be one, 10 step job, or two or three jobs requiring fewer operations. With automatic feed units on four of the spindles, an operator can start the first step and go on to second and third operations on other parts while the first spindle completes its cycle.

A final example of extending the range of the drill press: Mr. Diehl's production men use an overhead machine for drilling large panels, lathe beds, assemblies, or machine tables. The standard head is suspended from an overhead track, 12 ft long. The whole machine unit, including track and A-frame supports, can be moved from one department to another.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

Centrifugal collectors, mounted on the wall to save floor space, reclaim diamond dust from tool grinding operations at Tungsten Carbide Tool Inc., Detroit

Centrifugal Separators Recover Diamond Dust

Collection of grindings returns almost one-fifth the cost of abrasive wheels; bypass in ductwork permits use of diamond or other wheels on same machine

IF DIAMOND abrasive wheels are used in your plant, you can save an amount almost equal to one-fifth their cost by recovering the grindings.

Several centrifugal collectors reclaim diamond dust from grinding operations at Tungsten Carbide Tool Inc., Detroit. They were purchased from Torit Mfg. Co., St. Paul.

• **Compact, Inexpensive** — The units require no filters. They take little space and weigh only 65 lb each. Priced under \$200, each unit costs no more than the average

diamond grinding wheel.

Collectors used at Tungsten Carbide Tool are mounted on the walls. They can also be mounted on machinery, suspended from the ceiling, or placed on tables that take little more than 2 sq ft of floor space.

• **Proper Use Important** — Recovery of diamond particles is not practicable if they are mixed with other materials.

The Detroit firm recommends a bypass arrangement in the ductwork, so diamond and other abrasive wheels can be interchanged.

Coil and swatches of vinyl coated steel illustrate how the scope of steel is being broadened through research and development

A SPECIAL REPORT

STEEL

March 9, 1959

Warmth of Color and Feel Added to Strength of Steel

THE IMAGE of the steel industry and its product is changing.

It's evolution by design, rather than accident. Industry executives know that there's magic in the word steel. It conjures the image of a stable industrial giant with a product that has strength and utility. But they realize that such a reputation has its debit as well as its credit side.

Rightly or wrongly, an industry that has arrived is caricatured as one that is not overly aggressive in research and development.

Rightly or wrongly, steel as a product is caricatured as the construction material of skyscrapers,

bridges, ships, and tanks. It is not fully appreciated for its contributions to the comforts of everyday living—at home, at work, or at play.

Progressive steelmakers are working hard to change the industry's image in those areas through stepped up research and development and product promotion. U. S. Steel Corp., for example, is promoting the product with its LBW campaign: "Today's steels *lighten* your work, *brighten* your leisure, *widen* your world."

U. S. Steel's vinyl coated sheets are an example of what is being done through research and de-

velopment. The new product adds the styling versatility of color and texture to the strength of steel.

You can buy the material in any color you specify and in any texture that can be engraved on a roll. Unlike most plastic coated materials, it's not produced by lamination. U. S. Steel cures and bonds liquid plastisols to the metal in a continuous mill coating process. Result: A 100 per cent bond that will stand up under rigorous forming.

• **Test Marketed**—U. S. Steel's new product was born in a research laboratory several years ago. It has been test marketed for the last two

FORMABILITY: The material retains a complete bond even after severe drawing or forming into finished products like the box and parts shown above. You can shear, slit, punch, lock seam, stamp, draw, or roll form it without damage to the coating or change in color. It will withstand elongation of 30 per cent.

FASTENING: You can fasten it in almost as many ways as you do steel. Methods include: Nut and bolt, sheet metal screws, rivets, lock seam, entrapment, spring clip, steel-to-steel adhesive, vinyl extrusion, vinyl-to-vinyl adhesive, staple, tab, and crimp.

WELDING: You can weld the sheets on a production basis, but time, energy, and pressure must be controlled to avoid damage to vinyl. Since vinyl is an insulator, current flow must be regulated from back side.

years. A number of companies are already using the material in such products as portable electric heaters, room coolers, movable wall partitions, folding chairs, office tape dispensers, and doors.

At present, medium size appliances (heaters, coolers, fans, radios, and portable television receivers) constitute the biggest potential market. Reasons: 1. Their consumer appeal is enhanced. 2. They have a high degree of flexibility in fabrication. Major and minor appliances may be substantial consumers in the future.

Other potential markets include: Automotive (passenger car, station wagon, truck, and bus interiors); architectural (walls and room dividers); institutional furniture (school lockers, desks, chairs, radiator covers); office equipment; and surface and marine transportation.

• **Exterior Applications**—The product is primarily intended for interior use, but it may be suitable for some outside applications. U. S. Steel has been subjecting it to exposure tests for four years. Preliminary findings indicate that it will resist fading and corrosion as well as painted metal, but more experience is needed. If it will keep its appearance for six or seven years, it might be used for automotive roofs, hoods, or side panels.

• **Selling Points**—Richard B. Lord, the corporation's director of product development, cites these advantages of vinyl coated steel: 1. It's decorative because of its color and texture. 2. It's tough mechanically (resists abrasion and scratches), chemically (resists stain and corrosion better than most paint finishes), and electrically (has a dielectric strength of 750 volts per mil of coating thickness). 3. It has the "feel" of leather or tweed materials, a far cry from cold metal. 4. It deadens sound. 5. It's easily cleaned. 6. It's prefinished, expedites in-plant operations. 7. It can be formed or deep drawn without damage. 8. It's economical (usually costs less than plastic laminates, solid plastics, porcelain enamel, stainless steel, anodized aluminum, certain woods, and some upholstery).

• **Way To Sell More Steel**—The corporation's market objectives are twofold: 1. To resist the inroads

of nonferrous competitors. 2. To create new markets for steel.

Explains Bay E. Estes Jr., U. S. Steel's vice president, marketing: "We recognized that new competitive challenges in our market place were being felt from many nonferrous sources. New plastics, such as high-impact styrene, linear polyethylene, and the versatile phenol resins, were capturing some of the markets we had traditionally enjoyed for many prewar years. In addition, aluminum, plastics with reinforced glass fibers, pressure-processed wood products, and many other innovations were daily increasing the threats to our long accepted steel applications."

• **How It's Made** — U. S. Steel makes the product on a single line at its Irvin Works in Pittsburgh. Here's how: 1. A coil of cold-rolled or galvanized sheet is fed into a cleaning unit where all traces of foreign material are removed. 2. It moves into an electrochemical treating unit where a slight etching of the surface occurs and a slight chemical deposit is made. 3. It's roller coated with a thin film of thermosetting adhesive. 4. It passes over another roller coater where a primer material is applied to the reverse side as a corrosion protection. (This step may be eliminated if not required by the customer.) 5. The adhesive and the reverse surface protection are simultaneously cured in an oven. 6. Liquid vinyl is applied by a reverse roller coater and cured on the steel to produce a permanent bond. 7. While still hot, the sheet passes through embossing rolls where the texture is impressed in the vinyl. After cooling, the product is either coiled or cut to length.

Physical Properties—The coating can withstand considerable exposure to heat without loss of color, texture, or adhesion. It'll take 160° F continuously, 212° F for two days. It softens at 350° F, chars above 500° F. But it won't support combustion. In many cases, protection on the reverse side is unnecessary because the sheet is phosphatized in production. Also available for back protection are hot-dipped zinc, modified epoxy resins, and temporary chemical treatments. Indoor and outdoor tests indicate that underfilm corrosion is not a problem.

RICHARD B. LORD, U. S. Steel's director of product development, shows some brightly colored samples of vinyl coated steel. The cream and blue office walls are vinyl coated, too. The space heater and portable air conditioner show how the material is being used in medium size appliances. The material has two basic advantages over painted steel, says Mr. Lord: "Textured appearance and warmth . . . and remarkable resistance to scuffing, scratching, and abrasion . . ."

These materials won't stain it: Conventional die lubricants, alkaline cleaners, fountain pen ink, alcoholic beverages, detergents, acid cleaners, nail polish, and fruit acids. These stain permanently after long exposure: Iodine, ketone, lipstick, and acetone.

• **How It's Sold**—The product is sold through U. S. Steel's regular distribution channels. You can order it in gages from 18 through 28, widths from 24 to 52 in., and lengths from 30 to 144 in. It's also supplied in coils (up to 8000 lb). The liquid vinyl coatings are 0.008

to 0.030 in. thick. (Thickness may be specified in increments of 0.001 in. within that range.) Hardness is 60 to 90 Shore A durometer. You can order any color you want. Seven standard textures are available, but you can have an exclusive pattern if you prefer. Maximum texture depth is 0.005 to 0.006 in., leaving 4 to 6 mils of base coat.

• **What It Costs**—In most cases, you'll pay 20 to 35 cents a square foot. Prices vary with gage and order size. Examples: About 20 cents a square foot for 0.010 in. of vinyl (single color) on a 28 gage

Potential Applications

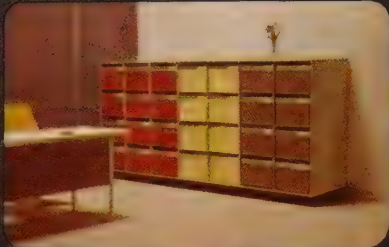

Reception Room

Escalator

Schoolroom

Office

Hotelroom

Industrial

"To the serious industrial designer, to the product planners of our industry, to progressive architects and industrial management—and American consumers—vinyl coated steel sheet is a real find."

So says Peter Muller-Munk. The Pittsburgh industrial designer was retained by U. S. Steel to explore end uses for the product. Shown above are some of the applications he suggests. "In all the industries we investigated, we discovered that vinyl coated steel was able to accomplish significant product improvement . . . we believe it opens up new avenues for the development of better, more lasting, and more economical products," he reports.

drawing quality sheet in quantities of 20,000 sq ft; about 24 cents for 24 gage; and about 35 cents for 18 gage. In the last example, the price is about two and one-half times that of the steel alone. Sheets made by the corporation's process are generally less expensive than other decorative materials. They may undersell vinyl coated steel sheets produced by lamination—sometimes by as much as 20 per cent. Com-

ments Mr. Estes: "The process economics of our method are consistent with our mill producing philosophy. The cost to consumers generally reflects the 'mill price' concept associated with high volume operations." Since U. S. Steel sells sheets to many of the laminators, it wishes them continued prosperity. They have an advantage: They can offer a wide variety of patterns in multicolored coatings.

U. S. Steel produces only solid colors at present.

• **Vinyls vs. Paint**—The most widely used decorative material that's competitive is painted or embossed steel. Here the economic situation is reversed. Vinyl coating usually costs significantly more than painting. "Fabricators aren't likely to substitute our product for painted steel on an economic basis," Mr. Lord admits. "They'll have to need our functions."

In some cases, resistance to scratching alone is sufficiently important to offset vinyl's higher cost. A television manufacturer found that he could make portable TV cabinets as cheaply with vinyl coated sheets as with painted steel. Reason: Painted cabinets were often so badly marred in assembly that they had to be repainted.

• **Size of Market**—How big is the market for vinyl coated sheets, when you consider all metals that can be coated? By one estimate, about 25 million sq ft of vinyl coated metals were sold last year. Assuming an average selling price of 40 cents a square foot, it's a \$10 million market. Within a few years, it may be \$30 million or \$40 million.

• **Needed: Faster Welding** — The big obstacles to tremendous growth are a lack of welding knowhow and suitable equipment. The sheets can be welded on a production basis, but time, energy, and pressure must be controlled to avoid damage to the coating. Since vinyl is an insulator, current flow must be regulated from the back side. Four basic techniques have been applied with success: Graham studwelding, projection welding (capacitor discharge), spring loaded electrode welding, and magnetic force welding. All are too slow for auto and appliance manufacturing. They use self-indexing equipment capable of 50 spotwelds a minute.

• **Impact**—That's the story, but it's really only the beginning. Color and texture have added a new dimension to steel.

• *An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.*

Air Hardening Steel Has High Strength at 1000° F

An air hardening specialty steel that resists softening upon continued exposure to temperatures of 1000° F is expected to find use as structural material in jet aircraft and allied equipment.

Produced by Latrobe Steel Co., Latrobe, Pa., the steel also provides high toughness and ductility at tensile strength levels up to 300,000 psi. Latrobe calls the material Dynaflex.

Another principal advantage: It can be fully hardened in large section sizes. The high tempering temperature that can be used brings about the nearly complete relief of residual hardening stresses necessary for maximum toughness at high strength.

Other characteristics of the material include ease of forming and working, good weldability, relatively low coefficient of thermal expansion, better than average corrosion and oxidation resistance, and low strategic alloy content.

Dynaflex contains 5 per cent chromium, 1.30 molybdenum, 0.90 silicon, 0.50 vanadium, 0.30 manganese, and 0.40 carbon.

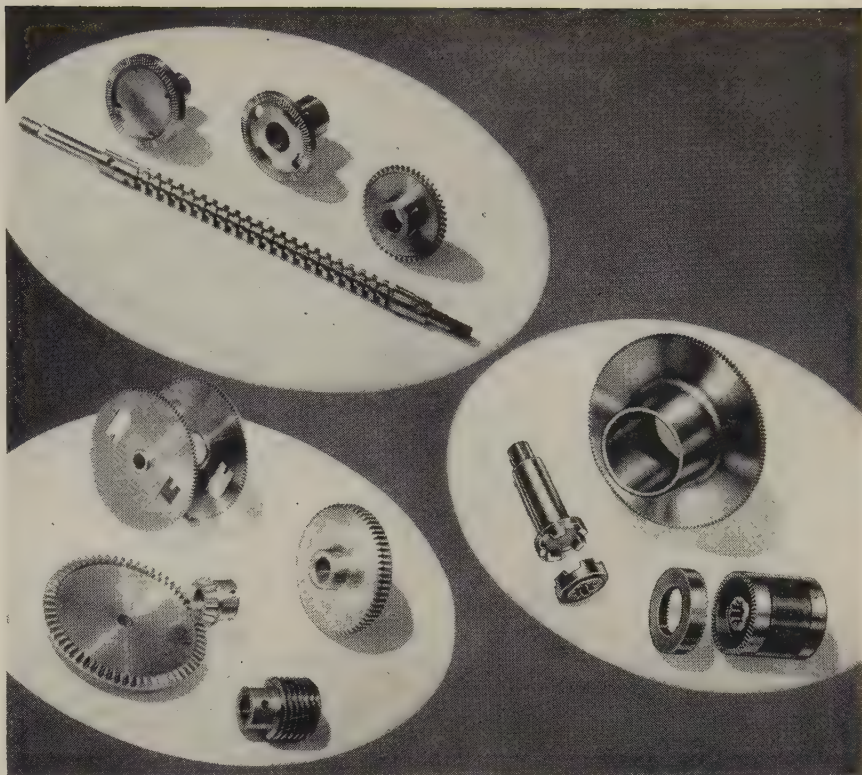

Spray Booth Lining Saves Clean-Up Time

A near-permanent release lining material for paint spray booths that saves clean-up time will pay for itself in five months, says the Fabrics Div. of E. I. du Pont de Nemours & Co., Wilmington, Del.

Tested in huge traveling spray booths by an eastern railroad, it reduced the number of manhours required to peel off accumulated overspray by one-third.

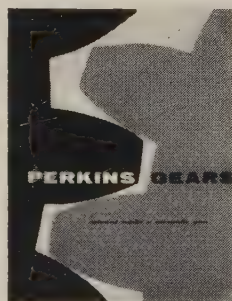

The technique consists of lining booths with Armalon TFE fluorocarbon coated glass fabric. Fairprene 5140 cement is used as the bonding agent.

No stripping lacquer is required with the lining because paint adheres loosely to its surface. Thick layers can be removed easily with the hands periodically over an indefinite period, says Du Pont. Accidental rips and tears can be readily patched.

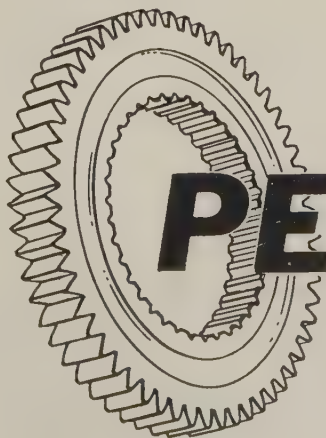

small and fine pitch gears for precision equipment

No matter how fine your gear requirements — Perkins can solve your problems. Perkins unique custom-gear engineering service, available to your engineering staff prior to the blueprint stage, will . . . eliminate production headaches . . . cut excessive costs. This service — recognized by leaders in the radar, electronic and missile fields, and backed by 52 years of custom gear experience — assures the precision quality needed to guarantee trouble-free operation. Don't gamble with gear performance . . . Perkins skilled personnel, together with modern up-to-date equipment guarantees fast delivery on prototypes or production runs. Call or write Perkins for complete information on custom-gear engineering and a quotation on your requirements. Then judge for yourself.

YOURS ON REQUEST
Folder showing custom gears Perkins has made (from various materials) for aircraft, automotive, precision instruments, home appliances, portable and machine tools, and other products. Includes Perkins facilities for producing various gear types and sizes. Write today.

Uniform flow of air through the blast nozzles prevents hot spots and burned lining. Fines are no longer blown out of the charge and up the stack

Automatic Tuyere Control Cuts Blast Furnace Wear

THE RIGHT controls will often reduce operating and maintenance costs and prevent loss of material.

An automatic control system, designed to balance the flow of air through blast furnace tuyeres, reduces blowing costs, prevents burning of furnace lining, and keeps fines in the charge from being blown out the stack. It's available from B-I-F Industries Inc., Providence, R. I.

• **Background** — Without control, flow of air into the blast furnace isn't uniform. Furnace back pressure varies at different points. Where pressure is low, the tuyeres

pass more air. Result: Hot spots develop on the walls of the furnace, and greater air velocity causes fines to be blown from furnace charge.

For several years, United States Steel Corp. has experimented with ways of controlling tuyeres. The first system used venturi tubes for measuring pressures, and ceramic lined butterfly valves for throttling.

An elbow meter, designed by B-I-F, and first used at the Fairless (Pa.) Works of U. S. Steel, eliminated the need for venturi tubes. An improved nozzle, also designed by B-I-F, was later introduced at the Gary (Ind.) Works of U. S. Steel. A control circuit for each

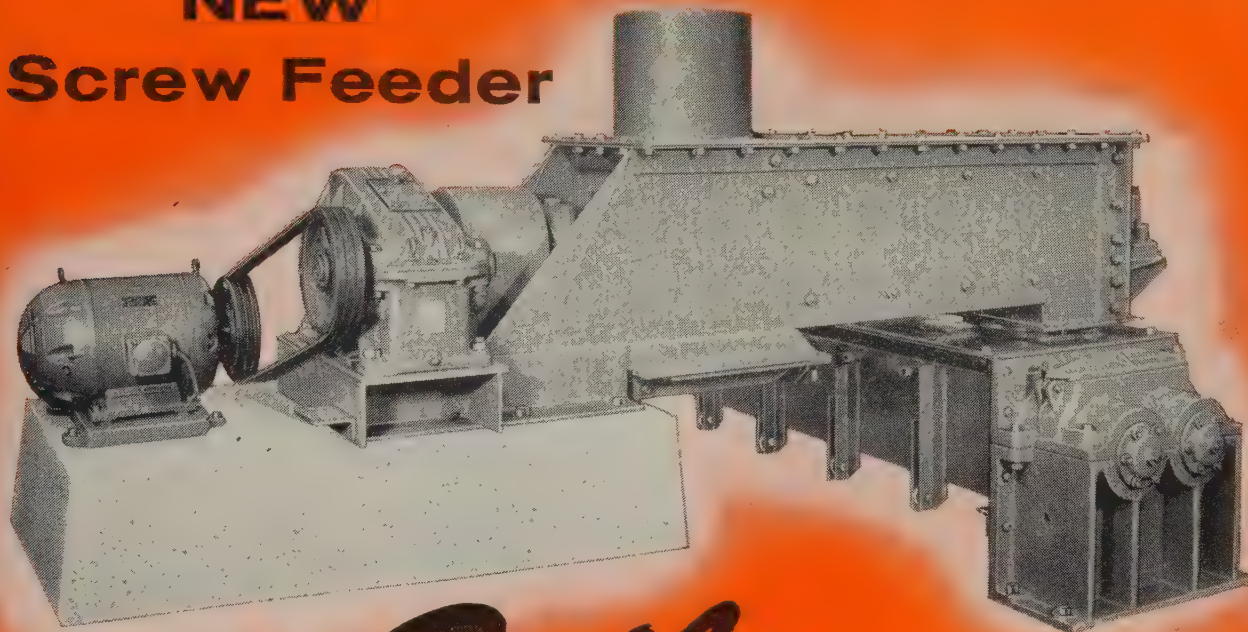

tuyere and a co-ordinating circuit complete the system.

• **How They Work**—Each tuyere is equipped with a flow nozzle, a balanced flow transmitter, a controller, a strip chart recorder, a four-way valve positioner, and a ceramic lined butterfly valve. If less than normal furnace back pressure causes a tuyere to pass more air than it should, the butterfly valve is throttled, reducing the flow of air.

If one of the tuyeres is plugged, the controller opens the butterfly valve, permitting more air to enter. If the tuyere can't deliver its share of air when the valve is wide open, more air is directed to the others. When they throttle back to prevent excess flow of air, bustle pipe pressure is increased, and obstructions are blown out.

A high pressure alarm circuit prevents bustle pipe pressure from exceeding a set limit. If the nozzle cannot be cleared with blasts of air below that pressure, it is switched out of the system.

NEW Screw Feeder

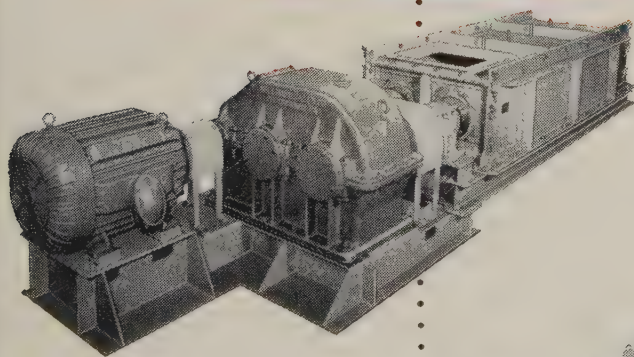

MAKES *Bailey* PUG MILLS

**EVEN MORE EFFECTIVE IN SINTERING PLANT
AND BLAST FURNACE DUST CATCHER SERVICE**

The new Bailey Screw Feeder is effective for flow regulation and conveying of flue dust, ore fines and various other materials. An outstanding feature is that it maintains uniform flow, even when irregular feeding may be caused by "hanging" of material in dust catcher or a sudden furnace "slip." The feeder speeds the sintering process and assures substantial savings through reduced handling costs.

BAILEY PUG MILLS were developed for low-cost processing of greater tonnages of more uniform sintered products. They are built for continuous service, in capacities from 100 to 400 tons per hour.

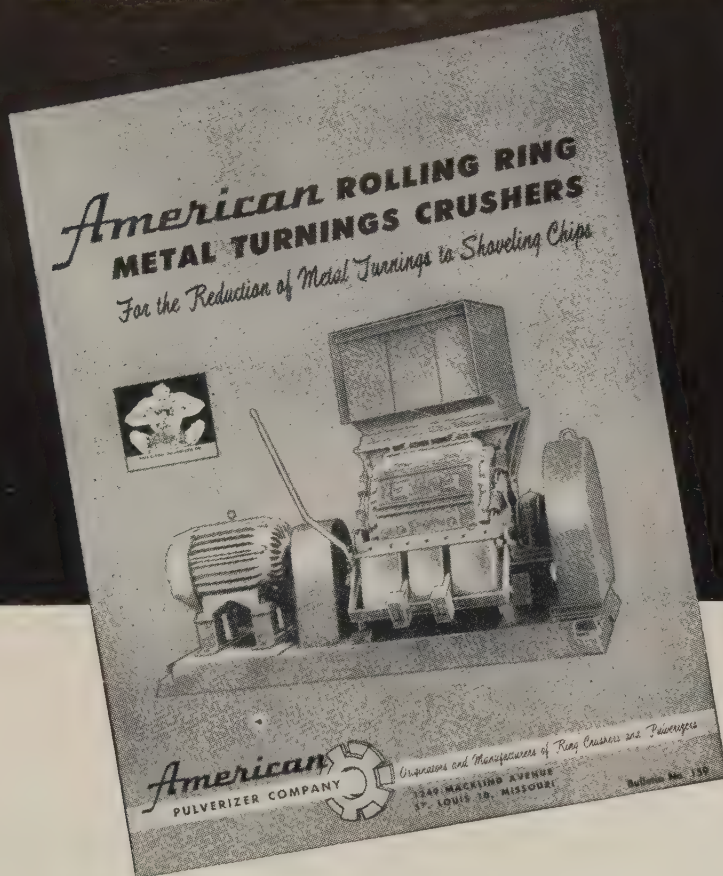

Write for Bulletins

This Bailey Double Shaft Pug Mill is equipped with a double helical gear reduction unit. Types of Bailey Pug Mills available include single and double shaft types, with direct or rope drives.

How you can turn METAL TURNINGS into additional PROFIT

If your plant has 20 tons or more metal turnings per month, this booklet will tell you how you can make a substantial yearly profit.

Metal turnings reduced to shoveling chips in an American Metal Turnings Crusher command \$2 to \$4 more per ton on the scrap market. In addition, you save 75% of storage space and recover 30-50 gallons more cutting oil per ton of turnings.

This booklet shows all models of American Metal Turnings Crushers with capacities from 2 to 50 TPH as well as installations showing conveyor systems, crushers and chip wringers.

Write today for Bulletin 159. It will pay you to have an American Metal Turnings Crusher in your plant.

Zinc Diecasting Slashes Gear Cost

ARE you realizing the full cost cutting potential of zinc diecastings? If not, take a tip from the experience of Minnesota Mining & Mfg. Co.

The 3M firm decided that the forming method it was using to produce identical mating, variable pitch gears for its copying machines was proving too costly.

Seeking a solution, 3M engineers consulted with Twin City Die Casting Co., Minneapolis. They found that the gears could be produced as zinc diecastings at a fraction of the previous cost and that machining could be eliminated. An added benefit: Uniformity of tooth shape, radiuses, and angles from piece to piece.

Now, gears can be so precisely duplicated that any two can be relied upon to mesh perfectly without danger of misalignment.

Each of the mating gears works from a fixed center. Each contains 23 teeth, each differently shaped. Pitch radiuses range from 0.240 to 0.840 in., the teeth are undercut, and none converges to a common center.

Because there can be no adjustment of shaft centers, tolerance requirements for the teeth must be within ± 0.001 .

Firm Makes Epoxy Mirrors

Precision optical mirrors made of epoxy resins are a major scientific advance, says Military Products Div., Singer Mfg. Co., New York.

An epoxy master negative is cast from a precision glass master. High quality duplicates are cast from the negative and coated with aluminum in a vacuum. The product, called Repli-Kote, faithfully duplicates complex curves. Physical properties are superior to those of glass—shocks as high as 22,000 Gs don't affect their accuracy.

Other advantages include: Faster production; integral mounting devices; infrared and electrical components can be molded into the plastic; corrosion resistance equal to glass counterparts.

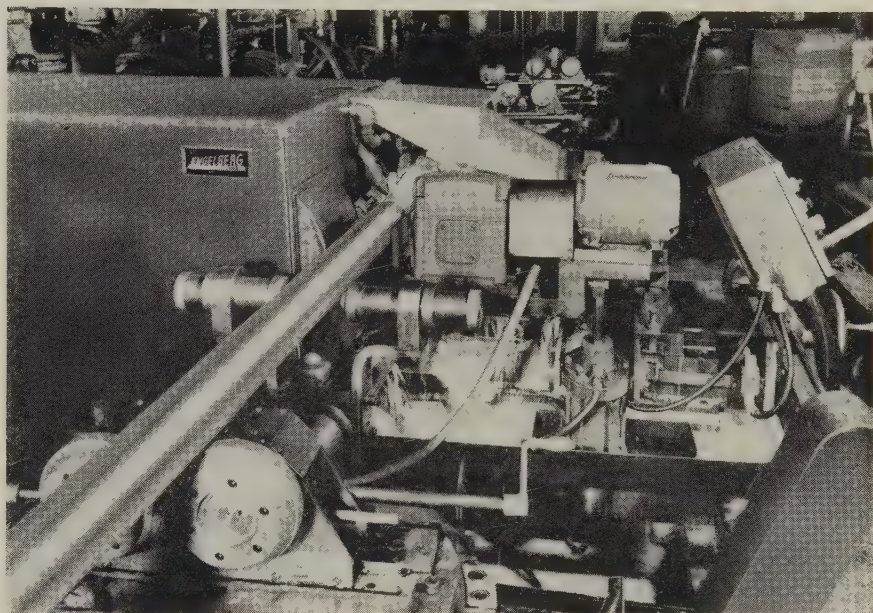

Centerless Belt Grinder Handles 9 in. Stock

CENTERLESS belt grinding of rods and tubes from 1 to 9 in. in diameter and any length is now possible.

The new Engleberg Model 8132-D machine permits heavy, single pass stock removal (up to 3 lb a minute), quality finishes, and close tolerances on ferrous and nonferrous metals. Average feed-through rates vary from 2½ to 20 fpm.

The machine has an outboard support mechanism with powered stands. The stands and the regulating wheel (it determines the speed and direction of the rotating stock) are driven by an adjustable frequency, alternating current power unit.

Stock is loaded on the outboard supports and fed into the abrasive belt by the stands working in conjunction with the regulating wheel. When the tube or rod has been ground along its entire length, it trips a microswitch which reverses the angle of the regulating wheel

and support wheels, and the stock feeds back past the belt grinding head.

The grinder also has a power in-feed control that is synchronized with the feed stands to provide cor-

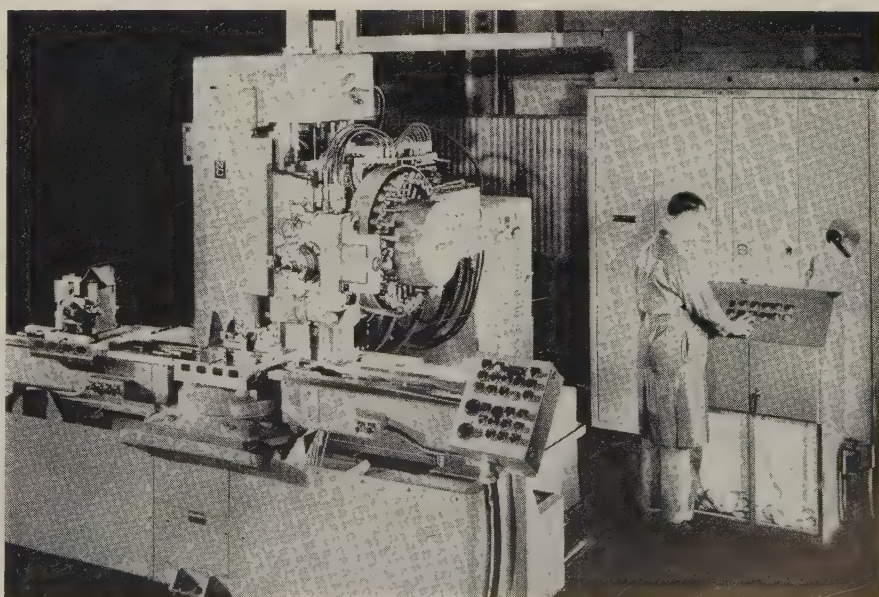

rect alignment and proper work height when changing from one diameter tube to another.

For more information, write Engleberg Inc., 831 W. Fayette St., Syracuse 4, N. Y.

Combination Machine Changes Tools Automatically

TYPE CONTROLLED milling, drilling, and boring are within the economic reach of the small-lot manufacturer. By reducing setup time, production time, labor costs, and inventory, the KTNC Milwaukee-atic can pay for itself in one to three years, says its builder.

As many as 31 different tools can be loaded into the machine. The tool is loaded into the spindle, and others into a revolving storage drum. To make tool changes, a transfer arm pivots out from its position beside the drum, simultaneously removes the tool from the spindle and one from the drum, rotates, and simultaneously inserts a new tool in the spindle and the other in the drum. Less than 9

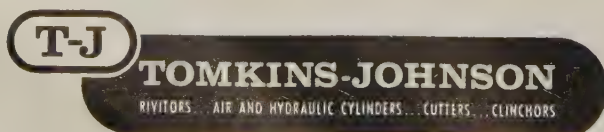

interchangeable with all
standard JIC cylinders

With the introduction of the ALL NEW T-J Squair Head, Tomkins-Johnson now offers industry the most complete design range of air and hydraulic cylinders. Presently available in bore diameters from 1-½ to 8 inches, the T-J Squair Head is an interchangeable cylinder which produces maximum force and efficiency, with minimum pressures . . . and is also adaptable to the use of low pressure oil as the working medium. Write today to The Tomkins-Johnson Co., Jackson, Michigan, for Bulletin #SQ 10-58 and complete details.

CHECK THESE 10 POINTS OF T-J SUPERIORITY

1. One Piece Piston
2. Hard Chrome Cylinder Bore and Piston Rods
3. High Tensile Steel Tie-Rods
4. Cushion Adjusting Screw, Externally Adjustable
5. New Super-Cushion for air, or Self-Aligning Master Seal for oil (T-J Patents)
6. Solid Steel Heads and Mounting Plates Standard all Models
7. Port Design Allows Minimum Pressure Drop on Inlet or Outlet
8. Chevron Type, Self-Adjusting Rod Packing
9. Piloted Packing Gland—Absolute Alignment
10. Piston Rod, Extra Strong—Polished and Chrome Plated for Efficiency and Protection

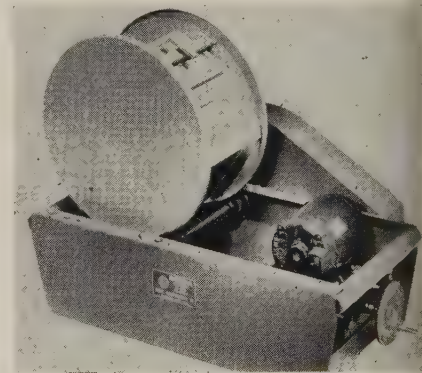

NEW PRODUCTS and equipment

seconds are required for changes.

A General Electric numerical control system directs worktable and spindle positioning, controls tool changes, speed, and feed. For more information, write Kearney & Trecker Corp., 6800 W. National Ave., Milwaukee 14, Wis.

Portable Tumbler Has Variable Speed Drive

PRECISION and portability for small parts finishing, deburring, and polishing are obtainable with the Model RA Rollabrader. The 0.5 cu ft machine has a variable speed barrel drive system adjustable from 20 to 46 rpm.

Other features include a vinyl barrel lining, convenient lifting handles on both barrel and machine bed, and welded construction suitable for steel ball burnishing.

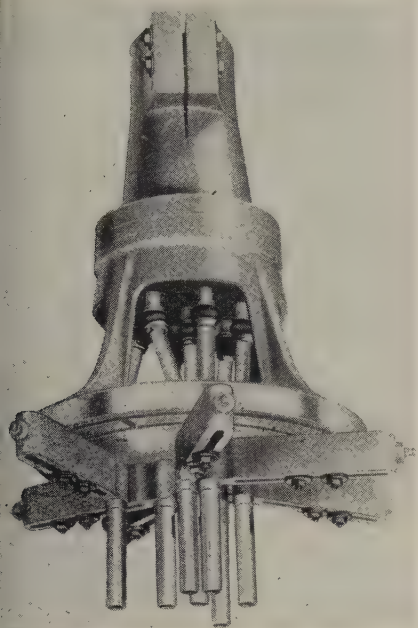

For more information, write Rampe Mfg. Co., 14915 Woodworth Ave., Cleveland 10, Ohio.

Multispindle Drill Head Has Snap-In Universals

THIS multiple spindle drill head converts any single-spindle drilling machine for profitable single pass, multiple hole work. It can be used for drilling, tapping, reaming, countersinking, and counterboring in a circle, straight line, or random pattern.

The universal joints which drive the spindle snap into place without tools. This arrangement cuts the time required for relocating spindles in different patterns.

The gear and bearing design al-

allows the drill head to be mounted in any position. With a 1:1 gear ratio furnished as standard, all drill head spindles operate at the same speed as the machine spindle. Other gear ratios are available.

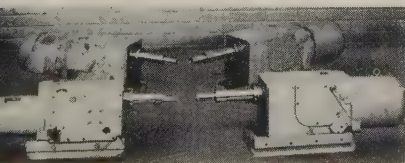

For more information, write Industrial Sales Div., Cleveland Pneumatic Industries Inc., 64 Old Orchard Rd., Skokie, Ill.

Drilling Units Have Long Strokes, Cam Feeds

QUILLS are fully extended in the photo of these automatic units to show the stroke length—4 in. on the Model 4 and 5 units, 5 in. on the Model 16 and 17 units. Models 4 and 16 are drilling units, Models 5 and 17 are companion tapping units.

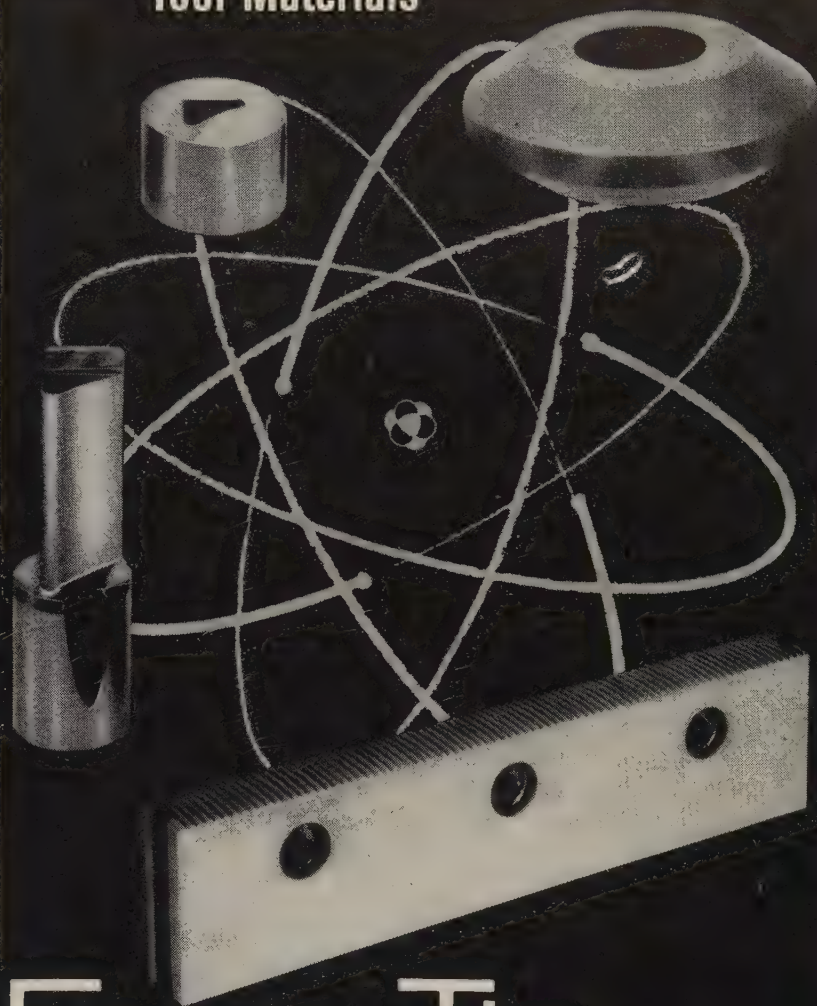

Each unit has a cam feed for accurate repetition of the work cycle. Follower segments make the stroke of the spindle double that of the feed cam. Different speeds, feeds, and strokes are available by changing speed and feed gears and the feed cam.

Each drilling unit may be con-

A completely new concept in Tool Materials

Ferro-Tic

(with proven performance)

the only machinable carbide in existence!

FOR: Blanking, Laminating, Deep Drawing and Heading Dies, Arbors, Core Rods, Wear Parts, etc.

FERRO-TIC combines the fabricating advantages of steel with the wear-resistance of carbide. In the annealed, completely dense state, FERRO-TIC can be machined with high-speed steel tools on conventional tool room equipment; thus, the need for costly diamond grinding is eliminated. Once hardened, by oil quenching from 1750°F, FERRO-TIC is extremely hard and wear-resistant. FERRO-TIC stock blanks can be fabricated into long-wearing carbide components, using available tools and skills without delay!

AGENTS THROUGHOUT THE U.S.A.

Speeds Floor Cleaning

THE Floormobile cleans factory and warehouse floors without raising dust. It does the job by suction seven times faster than pushbroom cleaning and works equally well in open floor or congested areas.

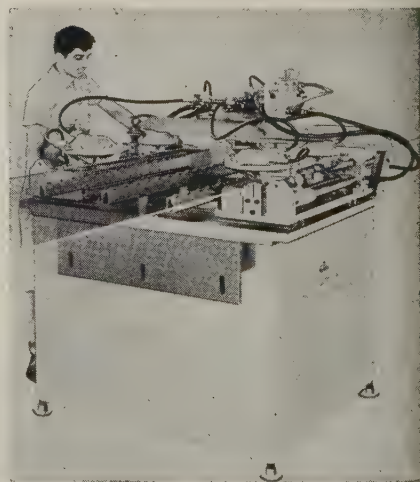

The new models, Series G-59M-1 and E-59M-1, have a 50 per cent increase in power, more suction, and a new, larger filter bag arrangement. The new filter lasts longer and it can be cleaned without removing from the machine.

The Litterdoor Nozzle, which opens so that bulky trash can be sucked up as easily as dust and dirt, is standard on both models. For more information, write Handling Devices Co., 34 Concord Lane, Cambridge 38, Mass.

Double Air Feed Handles Wide Stock in Presses

MATERIALS up to 60 in. wide can be fed into presses or shears with the Ses-Matic Double Air Feed. It can feed from any side of a press, and is easily moved from press to press or shear to shear.

In operation, the stock is gripped

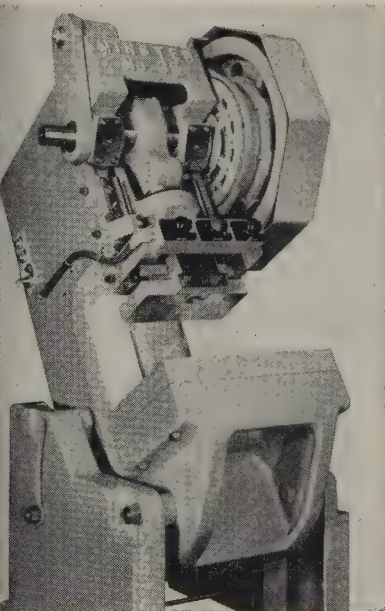

ong both edges of its width and
rried forward by two gripper
ads, each sliding on guide bars.
e stroke length is infinitely ad-
stable to the maximum of the
it. Metal-to-metal stops insure
act duplication of stroke length.
The stroke is cushioned at each
d by a self-contained hydraulic
eck. No adjustment is necessary
r changing from one stock thick-
ss to another.

Available as optional equipment

HARPER®

What CORROSION-RESISTANT Fastenings Do You Need?

Harper has manufactured fastenings in more than 100 differ-
ent corrosion-resistant alloys . . . Stainless Steels, Monel,
Silicon Bronze, Naval Bronze, Brass, Aluminum, Titanium.

What STANDARD Type and Size Do You Need?

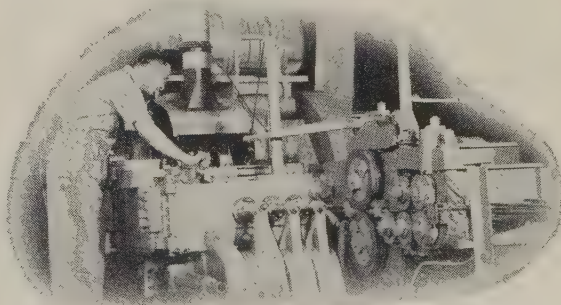

From #2 screw size through diameters of 2 inches, Harper
maintains the broadest standard product line in its industry
. . . and Harper Distributors are everywhere. See your Yellow
Pages.

What SPECIAL Type Fastenings Do You Need?

Cold Heading and Hot Heading techniques are a science at
Harper. Both "know-how" and facilities are directed toward
cost-reduction and quality improvement on your parts of non-
standard size and shape.

What EXTRA Benefits Does Harper Give YOU?

- You have assured supply because Harper pro-
duces its own raw metal.
- You receive immediate deliveries from local
stocks.
- You gain customer goodwill for your products
through Harper quality.
- You lower your costs by efficiencies in purchas-
ing, maintenance and assembly.

Power Drive Casters Solve Handling Problems

THE Electromite powered caster unit provides a solution for handling loads in the 1000 to 1600 lb class that usually are considered too light to be moved by expensive heavy duty equipment, but are too heavy to be moved by hand.

The caster can be installed on stock trucks, hydraulic lifters, hand trucks, or other loading equipment. Wheel sizes of 8, 10, and 12 in. make it easily adaptable.

It is designed to replace one or both rigid casters on a vehicle. Speeds in forward or reverse up to 10 mph are possible. The casters will accommodate up to 1600 lb. They are powered by a quickly rechargeable battery.

For more information, write Swartzbaugh Mfg. Co., Murfreesboro, Tenn.

Design Improvements Up Roller Bearing Capacity

YOU CAN upgrade the operation of your equipment with these high capacity roller bearings.

They have three major design improvements: Maximum diameter and quantity of convex rollers for each bearing size; precision machined, centrifugally cast bronze retainers; and high, heavy inner race shoulders.

They are available in bore sizes ranging from 1.5748 to 11.0236 in. with dynamic load ratings up to 288,000 lb. They will also be made in pillow blocks in bore sizes of 1 7/16 to 10 in.

For more information, write Link-Belt Co., Prudential Plaza, Chicago 1, Ill.

How to Select the Best Metal to Perform a Given Set of Functions

Any equipment part can be described, at least approximately, in terms of the functions it must perform. That is, it must provide a certain strength plus resistance to wear, fatigue, impact or

corrosion. The finished part must provide the best combination of all necessary factors at the lowest possible cost — a cost that must include machining, finishing and assembly where applicable.

Unique Production Method Combines Desirable Characteristics

The amount and form of carbon in ferrous metals is of prime importance. The carbon content of Malleable iron (2.00 to 2.60%) provides good fluidity at the pouring stage. Yet neither flake graphite nor combined carbon is present in finished standard Malleable iron.

As the photomicrograph of standard Malleable iron shows, the carbon has been transformed into temper carbon nodules in a matrix of ferrite during the heat-treatment given *all* Malleable iron

castings. The result is a metal with a unique combination of high strength, toughness and machinability.

Pearlitic Malleable irons differ from standard, or ferritic, Malleable only in that a controlled amount of the carbon is combined with the iron to form a pearlitic matrix around the temper carbon nodules. This increases strength, hardness, wear resistance and modulus of elasticity, while retaining good ductility and machinability.

TENSILE PROPERTIES — A.S.T.M. MINIMUM SPECIFICATIONS

New Savings Result

From the wide range of properties obtainable, a Malleable iron may be selected that will most completely meet ideal design and functional requirements. Because of the great latitude of producible sizes, from a fraction of an ounce to hundreds of pounds, Malleable can be used for a wealth of applications.

Malleable iron's economy is derived in two ways. First, the casting process is generally accepted as the most economical method of producing a finished part. Secondly, being the most machinable of all ferrous metals of similar hardness, cast or otherwise, Malleable iron castings provide exceptional economies in time, tool and power consumption.

Today's Malleable iron castings offer tremendous strength, uniformity, versatility and economy. The producers of Malleable castings are anxious to assist you in getting maximum "usability." Why not let their modern design, testing and production facilities work for you?

Send for Special Data Unit

Your copy of Data Unit No. 101 containing additional information on the benefits you can derive from Malleable iron castings is available from any member of the Malleable Castings Council. If you wish, you may direct your request to **Malleable Castings Council, Union Commerce Building, Cleveland 14, Ohio.**

ROLOCK TRAYS

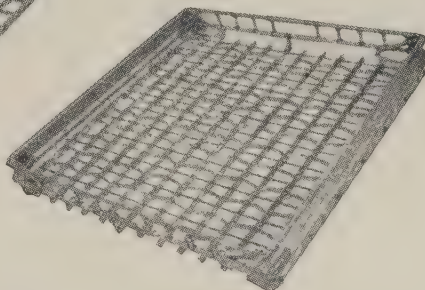

"Pressure Welded"
Furnished 2-layer
or 3-layer

"Serpentine"

"Pressure Welded"
with pusher pads

"Serpentine"
with load-retaining sides

ROLLER HEARTH FURNACE users have found these two basic RoLOCK Tray designs... and many possible variations... at once efficient and economical.

Not only can RoLOCK design and construction reduce tray weight (often by 25% to 50%) and thus increase pay-load, but service records frequently show that tray life has doubled or tripled.

These worthwhile savings have resulted from RoLOCK's engineering approach to tray design, taking into consideration details of the furnace hearth, tray load and weight ratios, method of operation, temperature limits and gradients and many other factors.

Complementing correct design, RoLOCK's unique "Serpentine" and "Pressure-Welded" construction features have proved to be, in many installations, the answer to problems of rapid tray deterioration. That is why RoLOCK today is a major supplier of furnace trays of these and many special types.

Why not make your own test. Let RoLOCK design and build your next replacements.

By design

this OLIVER-FARQUHAR Forming Press will cut your production rejects

By design this 1000-Ton Oliver-Farquhar Four-Column Hydraulic Forming Press has unusually rigid construction. This guarantees minimum deflection under full tonnage loads and close tolerance operation for accurate, high-output production.

By design it can be equipped with either manual or electric pushbutton controls. You can select the controls to match your production requirements. **By design** special high and low pressure fluid circuits are incorporated in this press. Fast advance, controlled pressing and fast return of the rams assure maximum production.

Oliver-Farquhar Hydraulic Presses are available in popular standard sizes from 50 to 5000-ton capacities. O-F Mechanical Gap Presses are available in 75 to 200-ton capacities. You are invited to write, wire or phone for details on these presses or, better still, ask for our proposals or recommendations. And remember, Oliver-Farquhar Conveyors can be designed and built to give you the ultimate in automated loading and unloading for maximum press production.

Steelmakers Smash Production Record

INGOT PRODUCTION hit an all-time high last week as steelmakers struggled to keep pace with their customers' demands.

Operating their furnaces at 90.5 per cent of capacity (up 1.5 points), they turned out 2,562,000 net tons of steel for ingots and castings. In their best previous week (Dec. 17-23, 1956), they produced 2,525,000 tons.

Last week's record was a long time in the making, but chances are it'll soon be broken. Steel-making operations may reach 95 per cent of capacity before the first half ends. In that event, we'll have a 2,690,000 ton week. Capacity operations aren't likely because: Demand for some products (rails, wire, pipe, and structurals) is relatively light. 2. Producers don't want to use high-cost, obsolete facilities.

OUTPUT TOPS CONSUMPTION—

Although metalworking's business is on the mend, the recovery hasn't been strong enough to justify current steel buying. These factors explain the rush:

1. Users carried liquidation too far last year, and they're trying to bring their inventories up to normal.
2. "Normal" inventories aren't big enough because mill deliveries are slower than usual.
3. As consumption rates increase, inventory targets are constantly being revised.
4. Strike fears encourage hedging.

SHEET DEMAND LEVELS—Midwestern mills are getting fewer orders for sheets—principally because they have almost nothing left to sell. In the East, demand is leveling off as consumers decide that they're adequately protected or pause for a second look.

CUSTOMERS APPLY PRESSURE— Since most steelmakers are sold out of sheets for the first half, they're concentrating on production problems. Although the order rush has slackened, there has been no letup in pressure from customers who think they may not have been given a fair shake. Those who were fortunate enough to get on the books show no disposition to push back releases or cancel. But this comment is being heard with increasing frequency: "If the steel labor talks in June look like they're going to result in a peaceful settlement, we'll have the damnedest revision of releases you ever saw."

BARs IN TIGHTER SUPPLY— Demand for bars reflects a marked improvement in current consumption and continued emphasis on inventory building. Stocks of some consumers are so low that they're in immediate need. Others, fearing a strike, are requesting May and June delivery of material that won't be needed until the third quarter. Knowing that bar mills expect little third quarter business, some consumers are making this proposition: They'll place orders for August and September delivery if sellers will guarantee to ship at today's prices.

STAINLESS LOOKS BRIGHTER—Producers of stainless sheets are boosting their output to meet improved demand in all markets. Strip producers have seen a moderate pickup.

J&L IN ELECTRICAL STEELS— Entering a market in which it has never previously participated, Jones & Laughlin Steel Corp. is taking orders for a series of new carbon electrical steels.

4 Groups Take More Steel, 17 Less

FOUR MARKETS for shipments of finished steel from mills in the U. S. took more tonnage in 1958 than in 1957. They did this in the face of a drop of nearly 20 million tons (25 per cent) in the total amount of all grades of steel shipped.

The four: Contractors' products; agricultural; appliances, utensils, and cutlery; and containers.

Declines were registered in the other 17 market groups in the American Iron & Steel Institute's annual summary of mill shipments.

Steel service centers (jobbers, dealers, distributors) continued as the biggest single market for mill shipments of finished steel. They took 18.20 per cent of 1958 shipments, vs. 18.16 per cent in 1957. The automotive industry retained its grip on second place, but its take dwindled slightly from 17.81 per cent in 1957 to 16.90 per cent last year. Construction (including maintenance) stayed in third place, but its share dropped from 15.67 per cent to 14.56. Containers firmed

their hold on fourth place by taking 10.96 per cent of 1958 mill shipments, compared with 7.81 per cent in 1957.

Mill shipments of alloy steel (other than stainless) were 1,399,364 net tons (29.50 per cent) less in 1958 than in 1957. Similarly, stainless and heat resisting steel fell 126,263 tons, or 20.37 per cent.

• An extra copy of this article is available until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, Ohio.

Distribution of Finished Steel in 1958 by Market Classification

Net tons of mill shipments of all grades, including carbon, alloy, stainless and heat resisting steel

Market Classification	Ingots, Blooms, Billets, Slabs, Sheet Bars, & Seamless Tube Rounds	Skelp	Wire Rods	Structural Shapes (heavy)	Steel Piling	Plates	Standard Rails (over 60 lb)	Rails (all other)	Joint Bars	Tie Plates

Sheets, Strip . . .

Sheet & Strip Prices, Pages 107 & 108

Although sheet and strip producers continue under tremendous pressure to accept orders from consumers whose inventories are dangerously low, demand appears to be leveling slightly. That's probably because: Many users are more adequately covered on strike hedge tonnage. The mills are tightening on their order acceptances.

In other years, sheetmakers were accused of pushing their customers into the market (particularly when a strike threatened). This year, though, buyers are doing the pushing. But the demand isn't entirely due to strike hedging; a good deal of it is generated by users' belief that prices will rise this summer, strike or no strike.

• **Well Protected**—Many consumers of cold-rolled and galvanized sheets (two grades in tightest supply) feel they are sufficiently protected for the remainder of the first half, and for a reasonable period beyond. As for hot-rolled sheets and specialties, on which deliveries are not as extended, they do not appear to be

pressing quite as hard for tonnage as they were a month ago.

They seem to be coasting for the present, while taking a second look at the situation. Most users expect a steel strike, but they're not sure it will necessarily come with the general termination of mill labor agreements at the end of June. They feel a walkout could conceivably come later in the summer, when the steelworkers might be strengthened by the end of the vacation season, and the approach of the seasonal fall upturn in manufacturing activity.

• **Berlin Watched** — The increasingly critical international political situation may also provide a reason for consumers to take a second look at their market position. There have been many "emergencies" during the postwar years, but the current Berlin crisis seems to be more serious than most of the others. In periods of mounting international uncertainty, there is often a disposition for market activity to slow down pending clarification of the outlook.

Trading continues brisk in sheets and strip. Producers, in addition

to being well committed on cold-rolled and galvanized throughout the first half, are booked solidly into early May on hot rolled, with increasing commitments beyond that month.

Also, they're well booked into second quarter on enameling and electrical sheets. Demand for the latter is strong not only from makers of household appliances, but also for distribution generators. Improvement in power generator needs (a longer term proposition) is less noticeable.

• **Heavily Booked**—Actually, sellers say there is not one important grade in the flat-rolled category in which they are not fully booked up for the second quarter. In an effort to discourage speculative buying, they are screening all inquiries closely. In some cases, the mills have turned back tonnage orders which they considered in excess of customers' normal buying patterns.

Automotive parts suppliers and appliance manufacturers are ordering substantial tonnage, and are pressing for deliveries by June 30. General Motors Corp. is stepping up its releases again, after the recent slowdown when Buick assemblies were curtailed.

Hot strip producers now are solidly booked on material 4 to 22 in. wide, but they still can take orders for first half delivery on narrow bands (mill edge only).

If it begins to look like there won't be a strike, there'll probably be wholesale revision of order books as consumers cancel tonnage, and hold up shipment releases.

Tin Plate . . .

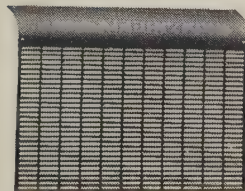

Tin Plate Prices, Page 108

Use of tin plate in the manufacture of containers for soft drinks is increasing. In part, the trend accounted for high level demand for tin plate when other steel products were moving slowly.

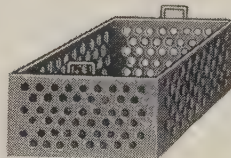

To meet rising requirements, the steel industry has been installing additional facilities. Jones & Laughlin Steel Corp. has installed new facilities at its Aliquippa Works at a cost of \$35 million. The works now produces electrolytic tin plate in standard and heavy gages and black plate and hot dipped tin plate in increased quantities.

It's estimated that the sale of soft drink cans this year will be about

Perforated Metal Products and Parts

Air Inlet Screen for Oil Burner

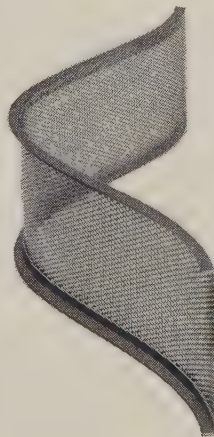

Pickling Basket

We, of course, supply manufacturers with perforated metal sheets and plates in a wide variety of sizes and shapes, from which they produce their own products and parts, but we are also fully equipped to relieve them of a great deal of this work. We weld, spot-weld, or rivet, stiffeners and

angles to the pieces and can form or flange them to special shapes as required. The items here shown are typical of hundreds we have furnished to other manufacturers during nearly a half century of successful experience.

YOU'LL SAVE MONEY in most cases, by placing orders with us for perforated metal parts, to be delivered in lots throughout the year in accordance with your production schedules. Specialized equipment and procedures will usually enable us to do the work at lower cost than it could be done in your own shops.

Send us your blue prints and specifications. When given sufficient information, our engineers are often able to make money-saving suggestions and always welcome an opportunity to do so.

Perforated Metal, spot-welded to specially formed angles.

DIAMOND MANUFACTURING CO., WYOMING PENNA.
(Wilkes-Barre Area)

New Bulletin No. 51, Describes DIAMONTEX Perforated Metal Lay-in Panels for Modern Acoustical Ceilings.

10 per cent above last year's figure—36,660 tons of tin plate, or 405 million cans. It means an increase of 20 per cent over 1957, when 33,743 tons of tin plate went into soft drink cans. Estimates for 1959 place output at 446 million cans. Sales could go to 350,000 tons by 1965.

Wire . . .

Wire Prices, Pages 108 & 111

Demand for wire products hasn't moved up as fast as that for most steel products, but in the manufacturers' products there is a disposition for users to order farther ahead.

For some products, there is still space on mill books in March, and there is adequate room in April schedules.

Indications are Midwest consumers are buying wire products a little more orderly than is the case in some other marketing areas. Users are not waiting with the expectation of acquiring their inventories in the last two months before a possible steel strike.

Merchant products are just starting to move. First quarter tonnage is expected to better 1958's corresponding period by 25 per cent. Manufacturers' wire volume will probably be 40 per cent better than a year ago.

Steel Bars . . .

Bar Prices, Page 106

The upswing in hot carbon bar inquiry is accelerating. Lagging behind light flat rolled steel demand in the current recovery, bars are now closing the gap. Some leading sellers are booked solidly into April, and have substantial bookings for shipment beyond. They anticipate high operations throughout the second quarter.

Demand reflects a marked improvement in consumption, and continued emphasis on inventories. Stocks of some consumers are so low they're in immediate need of tonnage. Others, fearing a strike induced shortage this summer, are requesting May and June delivery, though it won't be needed until the third quarter. Buyers seem unconcerned about the financial aspects of inventory building.

The betterment in demand is also noted in cold-drawn carbon and alloy bars, and in hot alloy bars. Only tool steel demand seems

to be really lagging, a situation that has prevailed for some time.

Although they're added shifts and recalled furloughed workmen, cold drawers can't turn out as much material as they could sell. Reason: They're getting eight week delivery promises from hot mills.

The gain in hot carbon bar inquiry is fairly general in some areas. In general, automakers, fastener manufacturers, screw machine interests, and electrical equipment suppliers are buying fairly heavy

volume. Demand from appliance makers and distributors is relatively slow.

Tubular Goods . . .

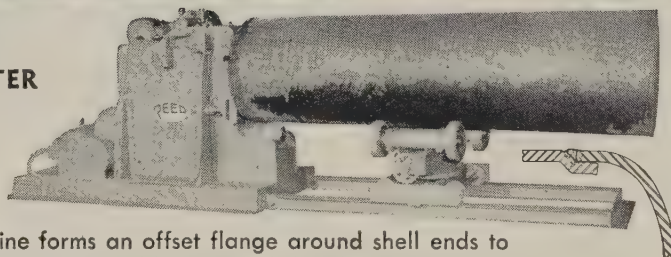

Tubular Goods Prices, Page 112

"We expect price increases, regardless of a midyear strike, and we're buying for shipment before June 30."

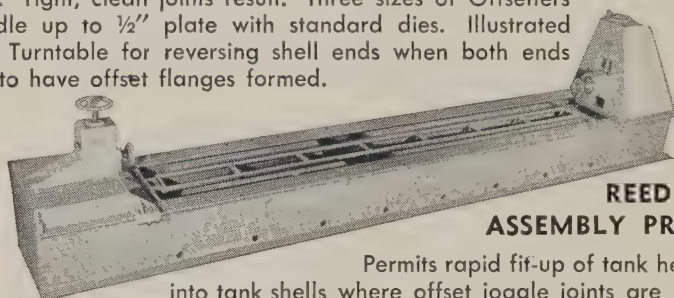

That's the way one of the largest pipe fabricating companies describes its pipe buying policy. Most pur-

WEBB TANK PRODUCTION MACHINERY

REED OFFSETTER

This machine forms an offset flange around shell ends to facilitate automatic welding of tank heads. It eliminates chill rings, decreases fit-up time, improves the concentricity of shell ends, and aids in reducing actual welding time. Tight, clean joints result. Three sizes of Offsetters handle up to 1/2" plate with standard dies. Illustrated with Turntable for reversing shell ends when both ends are to have offset flanges formed.

REED ASSEMBLY PRESS

Permits rapid fit-up of tank heads into tank shells where offset joggle joints are used. Hydraulic pressure is applied through ball-and-socket swivel joints that allow the head cups to set to the head. Hydraulically powered kick-outs speed up loading and unloading. Both headstock and tailstock are adjustable vertically; tailstock is also adjustable along the bed for various lengths of vessels up to 18'.

Fit-up rolls are also available to facilitate proper alignment and assembly of shells lacking rigidity.

**For sub-zero weld strength
in missile fuel storage tanks**

WELD WITH **ARCOS** 

STAINLESS ELECTRODES

When completed, this tank will hold a liquid propellant fuel under 125 lbs. psi. Service temperatures will range from plus 200°F down to *minus* 300°F. The customer selected type 321 stainless for the vessel. To assure required impact strengths at extreme temperatures, Arcos STAINLEND 19/9Cb electrodes were recommended. This top quality weld metal joins the heads, shell seams, fittings and all attachments. Again—the tougher the test, the greater the need for Arcos. ARCOS CORPORATION, 1500 S. 50th Street, Philadelphia 43, Pa.

chasers buying directly from the mills are following the same sort of policy.

Demand for seamless tubing extends into May. Volume for both April and May delivery is reported well above that for March. Most utilities are getting their orders on mill books, and some of the tonnage extends through June.

Mill stocks of seamless (12 in. and under) are reported being depleted; deliveries are steadily moving out.

Carbon and alloy mechanical and pressure tubing deliveries now extend eight to ten weeks.

Eastern district sellers note some improvement in demand, but they say there's nothing spectacular in the current movement. Most items are moving out of stock in the area. But demand in the Southwest is gathering momentum. Distributors of merchant pipe are not actively ordering for inventory. Their supplies of butt weld are substantial, and most mills can still ship from stock.

Northern California imports of pipe totaled 23,054 tons in the ten months ended last October. Most of it was galvanized, in sizes used for plumbing.

Distributors of cast iron pipe in the Pacific Northwest report seasonal quickening in demand is underway. Several large jobs are up for bids in the area. These include work at Tacoma and Port Angeles, Wash. A large water system expansion at Fairbanks, Alaska, involves 30,000 ft of water mains, bids on which go in at Juneau, April 1.

Reflecting the recent reduction in the price of zinc to 11 cents a pound, the prices of galvanized pipe have been automatically reduced.

Plates . . .

Plate Prices, Page 106

Inquiry for plates is expanding, with railroad needs picking up and construction requirements more active. In the latter category, highway and nonresidential construction, pipeline and heavy tank work predominate. Ship needs are well sustained.

A large Pittsburgh manufacturer of capital equipment is laying in a substantial plate inventory, although its sales haven't improved appreciably. By July 1, it expects to have enough steel on hand to

sustain operations for 90 days. While its prices may rise after mid-year, this equipment interest says it's not buying for speculative reasons. Its aim is to avoid a shut-down for lack of material in event of a steel strike. Some of its suppliers have announced that they can't accept any more orders for first half delivery.

Plate fabricators in New England are placing second quarter orders in slightly heavier volume, but this tonnage would be larger if more jobs were being estimated. Welded built-up girder volume is slightly more active, and shipyard demand is holding, but the pickup in demand on heavy industrial equipment account is not exciting anyone. Still, few shops in the district want to end the first half of the year with inventories down to the current level.

Pig Iron . . .

Pig Iron Prices, Page 113

General improvement in metalworking is stimulating foundry operations, but demand for merchant pig iron has not gained appreciably. Some sellers say there has been little change in market activity since the start of the year.

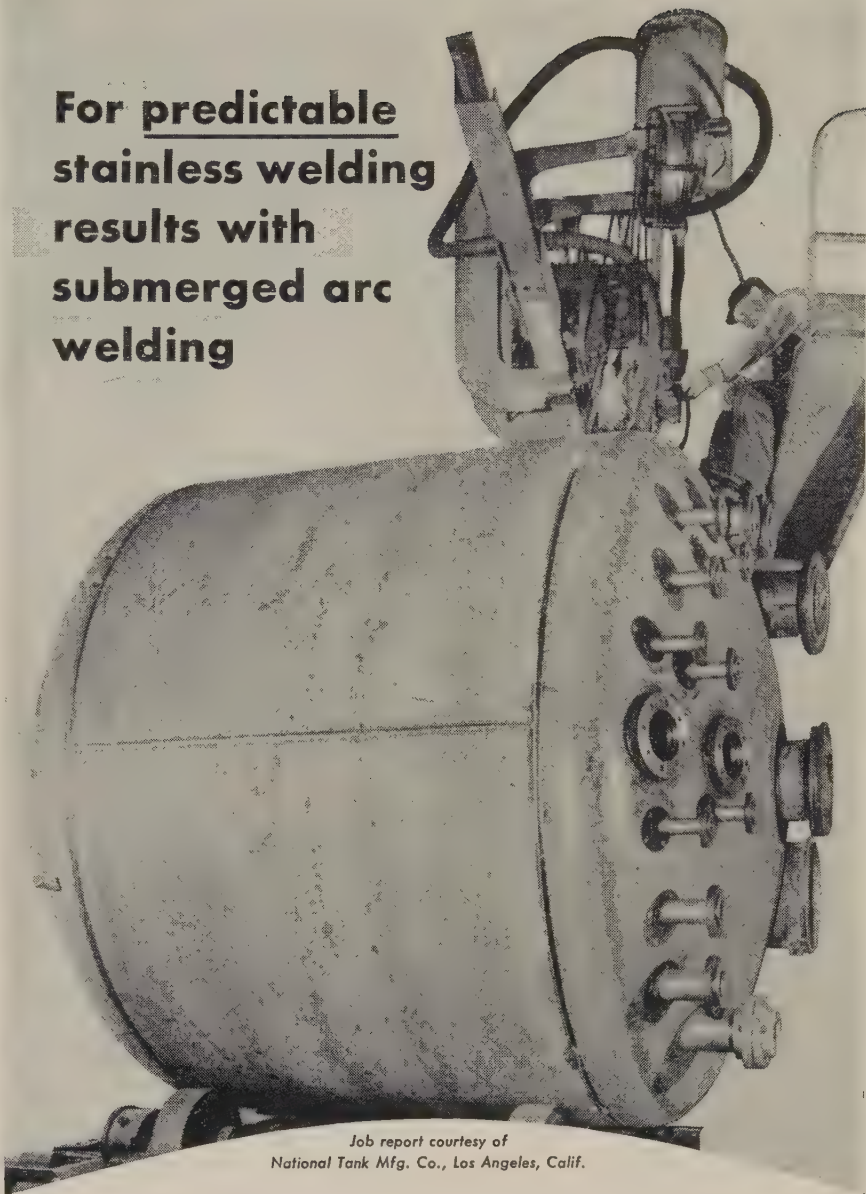

The long term outlook, however, is considered promising. A resurgence in metalworking such as has been experienced in recent weeks cannot continue for long without some noticeable impact on foundry activity. In some areas, noticeably in the Midwest, there has been some pickup as result of stronger demand for automotive castings.

Most foundries in western New York continue to operate on three and four day week schedules. Consumers of merchant iron are buying conservatively, apparently not being too concerned over a possible midyear steel strike.

Some blast furnace capacity is still idle. But additional stacks are being restored to production weekly. Last week, Sharon Steel Corp.'s No. 3 blast furnace at Farrell, Pa., had a breakout only a few days after the company had started up its No. 2 furnace. No. 3 stack will be down about 30 days for a relining job.

Republic Steel Corp. has started up its No. 5 blast furnace at Youngstown, the fourth unit in production at that works.

For predictable stainless welding results with submerged arc welding

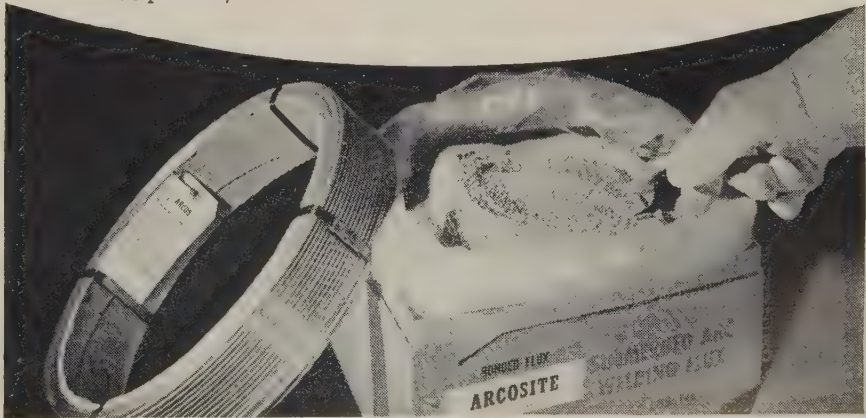

Job report courtesy of
National Tank Mfg. Co., Los Angeles, Calif.

use ARCOSITE BONDED FLUX

This 4,000-gallon tank for a resin reactor will handle highly corrosive material at temperatures of 500° to 600°F. Stainless top and bottom heads of type 316L were submerged arc welded to the body with Arcosite Flux and Arcos Chromenar Stainless Wire. This combination gives the proper weld metal chemistry for the needed corrosion resistance and an economical solution to the problem. ARCOS CORPORATION, 1500 S. 50th Street, Philadelphia 43, Penna.

Blast Furnaces Produce More Iron in January

Blast furnace production (pig iron and ferroalloys) in January totaled 6,260,395 net tons, reports the American Iron & Steel Institute. Of the total, 48,572 tons were ferromanganese and spiegeleisen. In the preceding month, output was 6,072,890 tons (including 47,505 tons of ferroalloys), and in January, 1958, the total was 4,854,444 tons (including 69,175 tons of ferroalloys).

Furnace operations averaged 77.9 per cent of capacity in January, vs. 78.6 in December, and 62.8 per cent in January, 1958. Production by states in January:

Blast Furnace Output—January, 1959
(Net tons)

By States:	Production	% of Capacity
Massachusetts, New York	359,809	69.0
Pennsylvania	1,592,967	71.0
Maryland, Virginia, West Virginia	559,462	79.8
Kentucky, Tennessee, Texas	151,660	82.6
Alabama	359,990	73.9
Ohio	1,151,686	74.5
Indiana	809,701	98.3
Illinois	508,302	75.8
Michigan, Minnesota	412,545	88.6
Colorado, Utah, California	354,273	89.9
Total	*6,260,395	77.9

*Includes 48,572 tons of ferromanganese and spiegeleisen.

Data from American Iron & Steel Institute.

Steel Wins Over Concrete For Stroudsburg Bridge

Bethlehem Steel Co., Bethlehem, Pa., will fabricate and erect steel-work for a four lane, continuous girder bridge spanning Brodhead Creek between Stroudsburg and

East Stroudsburg, Pa. It will replace a temporary structure that has served since the 1955 flood.

Originally designed in prestressed concrete, bids were also open to structural steel. Bethlehem came up with a steel structure of the same general appearance, profile, dimensions, and loadbearing characteristics as the concrete design, and was awarded the contract for the structural steel on a low bid basis.

J. Richard Nissley Inc. is the general contractor. About 630 tons of fabricated structural steel will be required. The bridge will have a 150 ft main span and two side spans, each 120 ft long. There will be two 25 ft roadways, each with two lanes, carried as separate bridges on common piers. Each roadway will have 9 in. curbs and an outside sidewalk 6 ft 9 in. wide, with a steel railing.

The steel supporting the 7½ in. concrete roadway will be shop welded girders with rolled wide-flange sections for floorbeams and stringers. All field connections will be with high strength bolts.

Distributors . . .

Prices, Page 113

Steel service centers shipped 15 to 30 per cent more tonnage in February than they did in January, and there's a strong trend toward continued improvement. That's what Pittsburgh area distributors report, and their views are pretty much in line with those of warehouse operators at most other points.

Demand has not accelerated as fast at the distributor level as it has

at the mill level. But the distributors are placing orders with the mills, covering themselves against customers' probable needs later.

Some consumers are pressing for quick deliveries because their stocks aren't big enough to sustain current higher manufacturing schedules. They are not ordering stocks as a strike hedge—and probably won't until it's clear mills won't be able to accommodate them.

Buffalo district warehouses have been enjoying a steady pickup in orders as more consumers turn to them to fill immediate needs. At St. Louis, steel service center volume was better in February than it was in January. Flat-rolled items gained the most. It's estimated that demand for them last month was 20 per cent higher than it was in January and about 30 per cent above the year-ago mark.

Record rainfall during February in the Southwest washed out predictions that the month would show a zooming volume increase for the area warehouses. The Houston district was drenched with more rain than at anytime since 1908. Construction work bogged down, and deliveries of all kinds suffered.

Service centers in the Pacific Northwest anticipate accelerated demand during the second quarter. While visiting the area last week, Robert G. Welch, executive vice president, American Steel Warehouse Association, said the Pacific Coast soon should share in the business revival which originated in the East. He added that galvanized and stainless steels are in particularly strong demand.

FASTENERS	
(Base discounts, shipments of one to four containers, per cent off list, f.o.b. mill)	

BOLTS	
Machine Bolts	
Full Size Body (cut thread)	
1/2 in. and smaller:	
3 in. and shorter	55.0
3 1/2 in. thru 6 in.	50.0
Longer than 6 in.	37.0
3/4 in., 3 in. & shorter	47.0
3 1/2 in. thru 6 in.	40.0
Longer than 6 in.	31.0
1/2 in. thru 1 in.	37.0
Longer than 6 in.	31.0
1 1/2 in. and larger:	
All lengths	31.0
Undersize Body (rolled thread)	
1/2 in. and smaller:	
3 in. and shorter	55.0
3 1/2 in. thru 6 in.	50.0

Carriage Bolts	
Full Size Body (cut thread) & Undersize Body (rolled thread)	
1/2 in. and smaller:	
6 in. and shorter	48.0
Larger diameters and longer lengths	35.0

Lag, Flaw, Tap, Blank, Step, Elevator, Tire, and Fitting Up Bolts	
1/2 in. and smaller:	
6 in. and shorter	48.0
Larger diameters and longer lengths	35.0

High Tensile Structural Bolts (Reg. semifinished hex head bolts, heavy semifinished hex nuts. Bolts — High-carbon steel, heat treated, Spec. ASTM A-325, in bulk. Full keg quantity)	
1/2 in. diam.	50.0
3/4 in. diam.	47.0
1 in. diam.	43.0
1 1/2 in. diam.	34.0

NUTS	
(Keg or case quantity and over)	

Square Nuts, Reg. & Heavy:	
All sizes	56.0

(Full container)	
Hex Nuts, Reg. & Heavy	
Hot Pressed & Cold Punched:	
1/2 in. and smaller:	62.0
1 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5

Hex Nuts, Semifinished, Heavy (Incl. Slotted):	
1/2 in. and smaller:	62.0
1 in. to 1 1/2 in., incl.	56.0
1 1/2 in. and larger:	51.5

Hex Nuts, Finished (Incl. Slotted and Castellated):	
1/2 in. and smaller:	65.0
1 in. to 1 1/2 in., incl.	57.0
1 1/2 in. and larger:	51.5

Semifinished Hex Nuts, Reg. (Incl. Slotted):	
1/2 in. and smaller:	62.0
1 in. to 1 1/2 in., incl.	65.0
1 1/2 in. and larger:	57.0

CAP AND SETSCREWS	
(Base discounts, packages, per cent off list, f.o.b. mill)	
Hex Head Cap Screws, Coarse or Fine Thread, Bright:	
6 in. and shorter:	
1/2 in. and smaller:	35.0
3/4 in., 1 in. and 1 1/2 in.	16.0

Longer than 6 in.:	
1/2 in. and smaller:	3.0
3/4 in., 1 in. and 1 1/2 in.	11.0

High Carbon, Heat Treated:	
6 in. and shorter:	
1/2 in. and smaller:	20.0
3/4 in., 1 in. and 1 1/2 in.	5.0

Longer than 6 in.:	
1/2 in. and smaller:	19.0
3/4 in., 1 in. and 1 1/2 in.	39.0

Flat Head Cap Screws:	
1/2 in. and smaller:	
6 in. and shorter	85.0

Set screws, Square Head, Cup Point, Coarse Thread:	
Through 1 in. diam.:	
6 in. and shorter	5.0
Longer than 6 in.	29.0

RIVETS	
F.o.b. Cleveland and/or freight equalized with Pittsburgh, f.o.b. Chicago and/or freight equalized with Birmingham except where equalization is too great:	
Structural 1/2 in., larger 12.85	
1/2 in. and smaller by 6 in. and shorter: 15.0%	

BOILER TUBES	
Net base a.l. prices, dollars per 100 ft. mill; minimum wall thickness, cut lengths 10 to 24 ft. inclusive.

Electrolytic Iron, Melting stock, 99.87% Fe, irregular fragments of 1/2 in. x 1.3 in.	28.75
(In contract lots of 240 tons price is 22.75c)	
Annealed, 99.5% Fe..	36.50
Unannealed (99 + % Fe)	36.00
Unannealed (99 + % Fe) (minus 325 mesh)	59.00
Powder Flakes (minus 16, plus 100 mesh)..	29.00

Carbonyl Iron:

98.1-99.9%, 3 to 20 microns, depending on grade, 93.00-290.00 in standard 200-lb containers; all minus 200 mesh

Aluminum:

Atomized, 500-lb drum, freight allowed	
Carlots	38.50
Ton lots	40.50
Antimony, 500-lb lots	42.00*
Brass, 5000-lb lots	33.50-49.60†
Bronze, 5000-lb lots	50.50-54.60†
Copper:	
Electrolytic	14.25*
Reduced	14.25*
Lead	7.50*
Manganese, Electrolytic:	
Minus 50 mesh	43.00
Nickel	80.60
Nickel-Silver, 5000-lb lots	51.60-56.00†
Phosphor-Copper, 5000-lb lots	62.80
Copper (atomized) 5000-lb lots	43.30-51.80†
Solder	7.00*
Stainless Steel, 304	1.07
Stainless Steel, 316	1.26
Tin	14.00*
Zinc, 5000-lb lots	19.00-32.20†
Tungsten:	
Carbon reduced, 98.8% min, minus 65 mesh	nom.**
1000 lb	2.80
less 1000 lb	2.95
Chromium, electrolytic 99.8% Cr, min metallic basis	5.00

*Plus cost of metal. †Depending on composition. ‡Depending on mesh. §Cutting and scarfing grade. **Depending on price of ore.

Electrodes

Threaded with nipple; unboxed, f.o.b. plant

Ferroalloys

MANGANESE ALLOYS

Pig-Iron: Carlot, per gross ton, Palmerton, Pa.; 21-25% Mn, \$105; 19-21% Mn, 1-3% Si, \$102.50; 16-19% Mn, \$100.50.

Standard Ferromanganese: (Mn 74-76%, C 7% approx) base price per net ton, \$245, Johnstown, Duquesne, Sheridan, Neville Island, Pa.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Add or subtract 2 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively (Mn 79-81%). Lump \$253 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract 2.60 for each 1% below 79%, fractions in proportion to nearest 0.1%.

High-Grade Low-Carbon Ferromanganese: (Mn 85-95%). Carload, lump, bulk, max 0.07% C, 35.1c per lb of contained Mn, carload packed 36.4c, ton lots 37.9c, less ton 39.1c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max 0.03% C, 3.5c for max 0.5% C, and 6.5c for max 1.5% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.006% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk, 25.5c per lb of contained Mn; packed, carload 26.8c, ton lot 28.4c, less ton 29.6c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 4% max, Si 1% max, C 0.2%). Carload, lump, bulk, 45c per lb of metal; packed, carload 45.75c, ton lot 47.25c, less ton lot. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carload, bulk, 33.25c; 2000 lb to min carload, 38c; less ton, 38c; 50 lb cans, add 0.5c per lb. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or any point east of Mississippi River; or f.o.b. Marietta, O., freight allowed.

Silicomanganese: (Mn 65-68%). Carload, lump, bulk, 1.50% C grade, 18-20% Si, 12.8c per lb of alloy. Packed, c.l. 14c, ton 14.45c, less ton 15.45c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% grade, Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lot, 2" x D, \$1.50 per lb of contained Ti; less ton to 300 lb, \$1.55. (Ti 38-43%, Al 8% max, Si 4% max, C 0.10% max). Ton lot \$1.35, less ton to 300 lb \$1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 0.8%). Contract min c.l. \$240 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi River and north of Baltimore and St. Louis. Spot, \$245.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2-4%). Contract, c.l. \$290 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed. Spot, \$295.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk, 23.75c per lb of contained Cr; c.l. packed 30.30c, ton lot 32.05c, less ton 33.45c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: Cr 63-66% (Simplex), carload, lump, bulk, C 0.025% max, 36.75c per lb contained Cr; 0.010% max, 37.75c. Ton lot, add 3.5c; less ton, add 5.2c. Delivered.

Cr 67-71%, carload, lump, bulk, C 0.02% max, 41.00c per lb contained Cr; 0.025% max, 39.75c; 0.05% max, 39.00c; 0.10% max, 38.50c; 0.20% max, 38.25c; 0.50% max, 38.00c; 1.0% max, 37.75c; 1.5% max, 37.50c; 2.0% max, 37.25c. Ton lot, add 3.4c; less ton lot, add 5.1c. Delivered.

Foundry Ferrochrome, High-Carbon: (Cr 61-66%, C 5-7%, Si 7-10%). Contract, c.l., 2" x D, bulk 30.8c per lb of contained Cr. Packed, c.l. 32.4c, ton 34.2c, less ton 35.7c.

Delivered. Spot, add 0.25c.

Foundry Ferrosilicon Chrome: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload packed, 8M x D, 21.25c per lb of alloy, ton lot 22.50c; less ton lot 23.70c. Delivered. Spot, add 0.25c.

Ferrochrome-Silicon: Cr 39-41%, Si 42-45%, C 0.05% max or Cr 33-36%, Si 45-48%, C 0.05% max. Carload, lump, bulk, 3" x down and 2" x down, 28.25c per lb contained Cr, 14.60c per lb contained Si, 0.75% x down 29.40c per lb contained Cr, 14.60c per lb contained Si.

Chromium Metal, Electrolytic: Commercial grade (Cr 99.8% min, metallic basis, Fe 0.2% max). Contract, carlot, packed, 2" x D plate (about 1/4" thick) \$1.15 per lb, ton lot \$1.17, less ton lot \$1.19. Delivered. Spot, add 5c.

VANADIUM ALLOYS

Ferrovandium: Open-hearth grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.20 per lb of contained V. Delivered. Spot, add 10c. **Special Grade:** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.30. **High Speed Grade:** (V 50-55% or 70-75%, Si 1.50% max, C 0.20% max) \$3.40.

Grainal: Vanadium Grainal No. 1 \$1.05 per lb; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract, less carload lot, packed, \$1.38 per lb contained V₂O₅, freight allowed. Spot, add 5c.

SILICON ALLOYS

50% Ferrosilicon: Contract, carload, lump, bulk, 14.60c per lb contained Si. Packed, c.l. 17.1c, ton lot 18.55c, less ton 20.20c, f.o.b. Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.45c to 50% ferrosilicon prices. **65% Ferrosilicon:** Contract, carload, lump, bulk, 15.75c per lb contained silicon. Packed, c.l. 17.75c, ton lot 19.55c, less ton 20.9c. Delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 16.9c per lb of contained Si. Packed, c.l. 18.8c, ton lot 20.45c, less ton 21.7c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 20c per lb of contained Si. Packed, c.l. 21.65c, ton lot 23.05c, less ton 24.1c. Delivered. Spot, add 0.25c.

Silicon Metal: (98% min Si, 1.00% max Fe, 0.07% max Ca). C.l. lump, bulk, 21.5c per lb of Si. Packed, c.l. 23.15c, ton lot 24.45c, less ton 24.45c. Add 0.5c for max 0.03% Ca grade. Add 0.5c for 0.50% Fe grade analyzing min 98.25% min Si.

Alsifer: (Approx 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.85c per lb of alloy; ton lot, packed, 10.85c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 39-43%, Fe 0.20% max). Contract, c.l. lump, bulk, 9.25c per lb of alloy. Packed, c.l. 10.45c, ton lot 11.6c, less ton 12.45c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 27.25c per lb of alloy, ton lot 28.4c, less ton 29.65c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferrobore: 100 lb or more packed (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over as follows: Grade A (10-14% B) 85c per lb; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borolit: (3 to 4% B, 40 to 45% Si). Carload, bulk, lump, or 3" x D, \$5.25 per lb of contained B. Packed, carload \$5.40, ton to c.l. \$5.50, less ton \$5.60. Delivered.

Carbortam: (B 1 to 2%). Contract, lump, carload \$320 per ton, f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 23c per lb of alloy, carload packed 24.25c, ton lot 26.15c, less ton 27.15c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Fe 1.5-3%). Contract, carload, lump, bulk 24c per lb of alloy, carload packed 25.65c, ton lot 27.95c, less ton 29.45c. Delivered. Spot, add 0.25c.

BRIQUETTED ALLOYS

Chromium Briquets: (Weighing approx 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk 19.60c per lb of briquet, in bags 20.70c; 3000 lb to c.l. pallets 20.80c; 2000 lb to c.l. in bags 21.90c; less than 2000 lb in bags 22.80c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx 3 lb and containing 2 lb of Mn). Contract, carload, bulk 14.8c per lb of briquet; c.l. packed, bags 16c; 3000 lb to c.l. pallets 16c; 2000 lb to c.l. bags 17.2c; less ton 18.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx 3 1/2 lb and containing 2 lb of Mn and approx 1/2 lb of Si). Contract, c.l. bulk 15.1c per lb of briquet; c.l. packed, bags 16.3c, 3000 lb to c.l. pallets 16.3c; 2000 lb to c.l. bags 17.5c; less ton 18.4c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx 5 lb and containing 2 lb of Si and small sizes, weighing approx 2 1/2 lb and containing 1 lb of Si). Contract, carload, bulk 8c per lb of briquet; packed, bags 9.2c; 3000 lb to c.l. pallets 9.6c; 2000 lb to c.l. bags 10.8c; less ton 11.7c. Delivered. Spot, add 0.25c.

Molybdenic Oxide Briquets: (Containing 2 1/2 lb of Mo each). \$1.49 per lb of Mo contained, f.o.b. Langeloth, Pa.

Titanium Briquets: Ti 98.27%, \$1 per lb, f.o.b. Niagara Falls, N. Y.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%). 5000 lb W or more \$2.15 per lb (nominal) of contained W. Delivered.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 50-60%, Si 8% max, C 0.4% max). Ton lots 2" x D, \$4 per lb of contained Cb; less ton lots \$4.05 (nominal). Delivered.

Ferrotantalum Columbium: (Cb 40% approx, Ta 20% approx, and Cb plus Ta 60% min, C 0.30% max). Ton lots 2" x D, \$3.80 per lb of contained Cb plus Ta, delivered; less ton lots \$3.85 (nominal).

SMZ Alloy: (Si 60-65%, Mn 5-7%, Zr 5-7%, Fe 20% approx). Contract, c.l. packed 1/2-in. x 12 M 20.00c per lb of alloy, ton lot 21.15c, less ton 22.40c. Delivered. Spot, add 0.25c.

Graphidox No. 4: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 20c per lb of alloy, ton lot 21.15c; less ton lot 22.4c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

V-5 Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 18.45c per lb of alloy; ton lot 19.95c; less ton lot 21.20c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

Simanal: (Approx 20% each Si, Mn, Al; bal Fe). Lump, carload, bulk 19.25c. Packed c.l. 20.25c, 2000 lb to c.l. 21.25c; less than 2000 lb 21.75c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of \$5 for each 1% of P above or below the base). Carload, bulk, f.o.b. sellers' works, Mt. Pleasant, Siglo, Tenn., \$120 per gross ton.

Ferromolybdenum: (55-75%). Per lb of contained Mo in 200-lb container, f.o.b. Langeloth and Washington, Pa., \$1.76 in all sizes except powdered which is \$1.82.

Technical Molybdenic Oxide: Per lb of contained Mo, in cans, \$1.47; in bags, \$1.46, f.o.b. Langeloth and Washington, Pa.

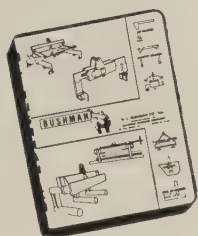

**HEADROOM?
No Problem!
and SIDE
CLEARANCE too!**

with the BUSHMAN COIL GRAB

Here's why...

- Minimum space requirement between piles? Of course! But you get so MUCH MORE because coil width cannot affect the extremely low headroom requirement of a Bushman Coil Grab... the supporting members slide horizontally... legs move parallel to one another — not in a space consuming "Pincer Motion".
- Handles 5 ton loads or more — Coil Grip hold remains safe and strong.
- Meets and solves needs of extreme coil width ranges — from the widest to the narrowest.

ANOTHER PANNIER MASTER MARKER!

PANNIER'S INSPECTORS' HAMMERS WEAR LONGER

Many styles and sizes for metal marking. Letters, numbers or symbols on either or both ends; interchangeable type heads available.

MONEY-SAVING FEATURES:

- Sturdy, balanced construction
- Long-lasting tool steel head
- A style for every (any) need
- Sharp, clean marking

Write for data.

**INTRODUCTION TO THE STUDY OF
HEAT TREATMENT OF METALLURGICAL PRODUCTS**

By Albert Portevin

Fundamental knowledge and essential principles of heat treatment of steel are presented in simple and understandable manner. Research engineers, metallurgical students and steel plant metallurgists engaged in metallurgical investigations and the heat treatment of ferrous and non-ferrous metals will find this book of inestimable value.

STEELMAKING SCRAP PRICE COMPOSITE

Based on No. 1 heavy melting grade at Pittsburgh, Chicago, and eastern Pennsylvania—Compiled by STRAIN.

Foundry grades are holding up fairly well, although a sympathetic drop is showing up on some items. Selective grades are bringing up-ward of \$50 a ton in limited tonnages. No change in this situation is expected this month.

Buffalo — Dealers expect March prices to ease a little because of weakness at other points and the heavy shipments taken by local mills during February. The foundries are not taking material as actively as the steel mills, but cast scrap prices are holding.

Cincinnati — Brokers' buying prices are off \$1 a ton on the principal grades. Mill buying programs for March are modest because of their large inventories. No. 1 heavy melting is quoted \$38.50-\$39.50, off \$1. Foundry demand for cast grades continues slow.

Houston—Brokers have not yet completed shipments on a limited order placed by the local steel mill. As a result, it's expected this steel-maker will delay entering the market with March orders.

Western Gulf exporters are moving slowly in filling Japanese orders. The outlook is for steady export activity the rest of this year. Japanese reports indicate that allocations for 1.7 million tons of U. S. scrap in the 1959 fiscal year will be announced in April. The tonnage, to be priced on the U. S. composite, would be twice 1958 imports from the U. S.

Birmingham — Most consumers are waiting to see if the drop in prices in the North will affect prices here. The current movement of tonnage is fair, but buying is limited. Open hearth steel consumers are on the sidelines, but a large electric furnace operator plans to enter the market early this month. Soil pipe manufacturers are buying more liberally at Anniston and Chattanooga, but local cast iron scrap prices are unchanged.

St. Louis—The market is weaker. Too much material is available. The mills are reducing inventories. As a result, all open hearth grades are down \$1 a ton. Most railroad scrap is off \$1 to \$2, and a further decline is expected. The downtrend is expected to continue.

San Francisco — Supplies are ample for steel mills' current requirements and the trend of prices (Please turn to Page 123)

Scrap Reacts to Sluggish Demand

STEEL's composite on the prime grade declines 50 cents a ton to \$42.33. Drop reflects lower bids on automotive lists at the end of February. Mill buying is limited

Scrap Prices, Page 118

Pittsburgh—Prices are weakening in spite of the district's 91 per cent steelmaking rate. Fisher Body Div.'s factory bundles brought \$49.50 to \$50.50 a ton (vs. \$51.37 in February). Railroad scrap prices are off as much as \$2 a ton. On Mar. 3, a major consumer bought scrap at these prices: No. 1 heavy melting, \$44; No. 2 heavy melting, \$37; No. 2 bundles, \$31.

Chicago—Prices are off \$1 to \$2 a ton in a listless market. The decline started when brokers bought No. 1 factory bundles from auto body plants at \$46-\$46.50 delivered. This material is offered at end of each month and at the end of January had sold at \$51 delivered. Since then a large district consumer has announced \$44 a ton as its March price for No. 1 industrial heavy melting steel, a drop of \$2 from February. All steelmaking grades are off proportionately, and even the foundry grades are \$1 to \$2 below recent sales.

Philadelphia — Scrap processors and dealers here say business is good. Prices are stable and no increase is expected.

New York — Brokers' buying

prices are unchanged. Scrap is coming out more freely, but there is sufficient consumption to keep the market in balance. Trading is fairly brisk—both domestic and foreign—and market sentiment is strong.

Cleveland—The market is noticeably weaker despite the high level of steelmaking operations. That's because month end bids on automotive lists were lower than at the end of January. Considerable scrap is being generated, and steelmakers still show a preference for hot metal. So dealer material is hard to move.

Detroit—Auto lists closed lower, and most of the tonnage was taken by local firms. As a result, No. 1 grades averaged a \$2-\$3 drop. McLouth Steel and Ford Motor are staying out of the market because they hold heavy scrap inventories. Great Lakes Steel is reported to have bought a small tonnage of No. 2 bundles at \$25, delivered.

The Canadian market is inactive.

The feeling among dealers and brokers is that the market can slip a few dollars more before the end of this month. Increasing tonnages generated by automakers may temporarily glut the market.

Iron and Steel Scrap

Consumer prices per gross ton, except as otherwise noted, including brokers' commission, as reported to STEEL, March 4, 1959. Changes shown in italics.

Use your AIM* ... Pressed Steel Tank Co. does ...
Unitizing reduces tank damage 75%

PRESSED STEEL TANK COMPANY, MILWAUKEE, WISCONSIN, cut damage claims 75% by using heavy-duty Acme Steel Strapping to unitize steel tanks. Working with their Acme Idea Man, a system was developed to strap tanks in units of four for fast handling and safe shipment. (Idea U6-29)

Acme Idea Man
 E. O. Schroeder
 worked with Pressed
 Steel Tank Company
 to devise unitizing
 methods.

Unitizing protects tank finish and prevents damage to exterior fittings. Tanks are held securely in position during shipment. This unitizing method also increases plant efficiency: although a strapping crew has been added, overall handling costs are less. Now the unitized tanks are handled entirely with mechanical equipment. Inventory control is simplified and storage space is more efficiently utilized. Customers appreciate improved arrival condition, too!

***Use your Acme Idea Man.** Problem solving in product handling and shipping is his business. Call him at the nearest Acme Steel office. Or write Dept. SDU-39, Acme Steel Products Division, Acme Steel Company, Chicago 27, Illinois. In Canada, Acme Steel Company of Canada, Ltd., 743 Warden Ave., Toronto 13, Ontario.

STEEL STRAPPING

Copper Price Could Go Up

All the factors are present for a boost of 1 to 2 cents a pound in primary. Custom smelter price moves up in two 0.5 cent stages. Platinum market strengthens

Nonferrous Metal Prices, Pages 122 & 123

NOTICE to copper buyers: Don't be surprised if you see primary producers raise their prices momentarily. The stage is set, and all the props that indicate an impending hike are present.

• **Behind the Scenes**—Here's the situation: Copper is in tight supply. Customers who can't get all they want from primary producers have turned to custom smelters whose supply is limited because of a tight scrap market. Some users are reportedly paying a premium to dealers for the red metal.

There's undoubtedly some "artificial" buying in the market because of fears of a midsummer strike, but it doesn't seem to be as widespread as some reports indicate.

It is true that some buyers have become panicky, and some metalmen fear there's a chance of a run-away market.

• **Why Copper's Tight**—Normally these conditions wouldn't bring such a tight market. But imports, which usually account for a good percentage of U. S. consumption, are down to a trickle. The reason's simple: The London Metal Exchange quotation is around 31 cents a pound, compared with the domestic primary quotation of 30 cents. Besides, if a foreign producer were to ship to the U. S. today, he would have to pay 1.7 cents a pound duty. It just wouldn't be profitable.

Another bullish factor is custom smelted copper. It's up to 32 cents a pound and could go higher.

Strikes at a U. S. smelter and a Chilean mine are putting even more pressure on copper's price.

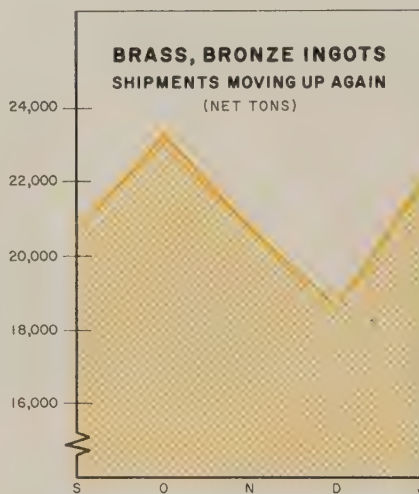

• **Outlook**—The copper situation boils down to this: Either some of the bullish tones in the market will have to disappear quickly or

the price will probably rise 1 to 2 cents a pound.

Platinum Market Stronger

After a long siege of spotty demand and steadily declining prices, the platinum market is showing signs of muscle flexing.

By last week prices in the New York market had shot up to \$67

Source: Council of the Ingot Brass and Bronze Industry.

an ounce in wholesale quantities and \$77 an ounce in retail lots.

Observers cite this reason for the metal's spurt: For some time the Russians had been dumping platinum on the world market for any price they could get. Several weeks

ago they decided to withdraw as a seller (evidently finding it unprofitable). This touched off a buying spurt as users started purchasing to fill immediate needs and to replenish inventory.

If Russia stays out of the market, there may be a temporary shortage and more price increases.

Little Pickup This Quarter

Metal sales hit their 1958 peak in the fourth quarter—about the level of business most producers are enjoying now. Here's a rundown on three key metals:

• **Nickel**—Demand is running at a "satisfactory" level. Consensus: There will be little change in sales over the next few months. Prices will hold steady at least through the first half.

• **Magnesium**—Sales are ahead of where they were in the same period last year and about where they were in the fourth quarter. Foundry business is picking up; wrought products are "holding their own." Look for primary production to hit around 44,000 tons this year. It's unlikely you'll see any price fluctuations during the next six months.

• **Titanium**—January mill product shipments hit an estimated 530,000 lb to register the best month since September, 1957. The February figure probably wasn't that good, but it was still way ahead of the corresponding period last year. Both sponge and mill product prices look stable.

Quotations in cents per pound based on: COPPER, mean of primary and secondary, deld. Conn. Valley; LEAD, common grade, deld. St. Louis; ZINC, prime western, E. St. Louis; TIN, Straits, deld. New York; NICKEL, electrolytic cathodes, 99.9%, base size at refinery, unpacked; ALUMINUM, primary pig, 99.5+%, f.o.b. shipping point; MAGNESIUM, pig, 99.8%, Velasco, Tex.

ALLIANCE has long been recognized as the "World's largest builders of the world's largest cranes". But size doesn't automatically answer a customer's needs.

ALLIANCE meets customer's capacity requirements with skillful engineering, and absolute minimum of downtime and maintenance.

Look to ALLIANCE for greater overall return for your investment.

Regardless of size or capacity,
for economy of operation,
ALLIANCE LEADS THE WAY.

Nonferrous Metals

Cents per pound, carlots except as otherwise noted.

PRIMARY METALS AND ALLOYS

Aluminum: 99.5%, pigs 24.70; ingots, 26.80, 30,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 28.60; No. 43, 28.40; No. 195, 29.40; No. 214, 30.20; No. 356, 28.60; 30 or 40 lb ingots.

Antimony: R.M.M. brand, 99.5%, 29.00; Lone Star brand, 29.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 24.50-25.00, New York, duty paid, 10,000 lb or more.

Beryllium: 97% lump or beads, \$71.50 per lb, f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, \$74.75 per lb of contained Be, with balance as Al at market price, f.o.b. shipping point.

Beryllium Copper: 3.75-4.75% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. shipping point.

Bismuth: \$2.25 per lb, ton lots.

Cadmium: Sticks and bars, \$1.45 per lb deld. **Cobalt:** 97.99%, \$1.75 per lb for 500-lb keg; \$1.77 per lb for 100 lb case; \$1.82 per lb under 100 lb.

Columbium: Powder, \$55-85 per lb, nom.

Copper: Electrolytic, 30.00 deld.; custom smelters, 32.00; lake, 30.00 deld.; fire refined, 29.75 deld.

Germanium: First reduction, less than 1 kg, 41.00 per gram; 1-10 kg, 37.00 per gram; intrinsic grade, 35.00-37.00 per gram.

Gold: U. S. Treasury, \$35 per oz.

Indium: 99.9%, \$2.25 per troy oz.

Iridium: \$75-80 nom. per troy oz.

Lead: Common, 10.80; chemical, 10.90; cor-rod, 10.90, St. Louis, New York basis, add 0.20.

Lithium: Cups or ingots, 50-100 lb, \$10 per lb, f.o.b. Minneapolis; 100-500 lb, \$9.50 per lb deld.

Magnesium: Pig, 35.25; ingot, 36.00 f.o.b. Velasco, Tex.; 12 in. sticks, 59.00 f.o.b. Madison, Ill.

Magnesium Alloys: AZ91A (diecasting), 40.75 deld.; AZ63A, AZ92A, 9291C (sand casting), 40.75, f.o.b. Velasco, Tex.

Mercury: Open market, spot, New York, \$218-221 per 76 lb flask.

Molybdenum: Unalloyed, turned extrusion, 3.75-5.75 in. round, \$9.60 per lb in lots of 2500 lb or more, f.o.b. Detroit.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 74.00; 10-lb pigs, unpacked, 78.25; "XX" nickel shot, 79.50; "F" nickel shot for addition to cast iron, 74.50; "P" nickel, 5 lb ingots in kegs for addition to cast iron, 75.50. Prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 1.01. Nickel oxide sinter at Buffalo, New York, or other established U. S. points of entry, contained nickel, 69.60.

Osmium: \$70-100 per troy oz nom.

Palladium: \$16-18 per troy oz.

Platinum: \$67-77 per troy oz from refineries.

Radium: \$16-21.50 per mg radium content, depending on quantity.

Rhodium: \$122-125 per troy oz.

Ruthenium: \$55-60 per troy oz.

Selenium: \$7.00 per lb, commercial grade.

Silver: Open market, \$1.375 per troy oz.

Sodium: Solid pack, c.l., 19.50; l.c.l., 20.00; brick, c.l., 21.00; l.c.l., 21.50; tank car, 17.00.

Tantalum: Rod, \$60 per lb; sheet, \$55 per lb.

Tellurium: \$1.65-1.85 per lb.

Thallium: \$7.50 per lb.

Tin: Straits, N. Y. spot and prompt, 103.75.

Titanium: Sponge, 99.3 + % grade A-1, ductile (0.3% Fe max.), \$1.62-1.82; grade A-2 (0.5% Fe max.), \$1.70 per lb.

Tungsten: Powder, 98.8%, carbon reduced, 1000-lb lots, \$2.75-2.90 per lb nom., f.o.b. shipping point; less than 1000 lb, add 15.00; 99 + % hydrogen reduced, \$3.30-3.80.

Zinc: Prime Western, 11.00; brass special, 11.25; intermediate, 11.50, East St. Louis, freight allowed over 0.50 per lb. New York basis, add 0.50. High grade, 12.00; special high grade, 12.25 deld. Diecasting alloy ingot No. 3, 13.50; No. 2, 13.75; No. 5, 14.00 deld.

Zirconium: Reactor grade sponge, 100 lb or less, \$7 per lb; 100-500 lb, \$6.50 per lb; over 500 lb, \$6 per lb.

(Note: Chromium, manganese, and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 23.875-25.25; No. 12 foundry alloy (No. 2 grade), 21.75-22.00; 5% silicon alloy, 0.60 Cu max., 24.75-25.00; 13 alloy, 0.60 Cu max., 24.75-25.00; 25-26.00; 103 alloy, 22.25-22.50. Steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 23.75; grade 2, 22.50; grade 3, 21.25; grade 4, 19.75.

Brass Ingot: Red brass, No. 115, 30.00; tin bronze, No. 225, 40.50; No. 245, 34.25; high-leaded tin bronze, No. 305, 34.25; No. 1 yellow No. 405, 24.50; manganese bronze, No. 421, 26.75.

Magnesium Alloy Ingot: AZ63A, 37.50; AZ91B, 37.50; AZ91C, 41.25; AZ92A, 37.50.

NONFERROUS PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb; nom. 1.9% Be alloy.) Strip, \$1.895, f.o.b. Temple, Pa., or Reading, Pa.; rod, bar, wire, \$1.875, f.o.b. Temple, Pa.

COPPER WIRE

Base, soft, f.o.b. eastern mills, 20,000-lb lots, 35.35; l.c.l., 35.98. Weatherproof, 20,000-lb lots, 36.29; l.c.l., 37.04.

LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh.) Sheets, full rolls, 140 sq ft or more, \$16.50 per cwt; pipe, full coils, \$16.50 per cwt; traps and bends, list prices plus 30%.

TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill.) Sheet and strip, \$7.50-17.00; sheared mill plate, \$5.25-10.00; wire, \$5.75-10.00; forging billets, \$3.55-5.75; hot-rolled and forged bars, \$4.25-7.50.

ZINC

(Prices per lb, c.l., f.o.b. mill.) Sheets, 26.00; ribbon zinc in coils, 21.50; plates, 20.00.

ZIRCONIUM

Plate, \$12.50-19.20; H.R. strip, \$12.50-22.90; C.R. strip, \$15.90-31.25; forged or H.R. bars, \$11.00-17.40.

15.00; ovals, 20.00, ton lots.

CHEMICALS

Aluminum Oxide: \$1.45 per lb in 100-lb drums.
Sulfuric Acid (flake): 100-2000 lb, 31.00; 2000-
10000 lb, 30.50; 10,000-20,000 lb, 30.00; 20,000
lb or more, 29.50.
Copper Cyanide: 100-200 lb, 65.90; 300-900
lb, 63.00; 1000-19,900 lb, 61.90.
Copper Sulphate: 100-1900 lb, 15.65; 2000-5900
lb, 13.65; 6000-11,900 lb, 13.40; 12,000-22,900
lb, 13.15; 23,000 lb or more, 11.90.
Zinc Chloride: 100 lb, 45.00; 200 lb, 43.00;
400 lb, 42.00; 400-4900 lb, 40.00; 5000-9900 lb,
37.00; 10,000 lb or more, 37.00.
Zinc Sulphate: 5000-22,999 lb, 29.00; 23,000-
9999 lb, 28.50; 40,000 lb or more, 28.00.
Aluminum Cyanide (Cyanobrik): 200 lb, 20.80;
400 lb, 19.80; 1000-19,800 lb, 18.80; 20,000
lb or more, 17.80.
Aluminum Stannate: Less than 100 lb, 80.60; 100-
1000 lb, 71.20; 700-1900 lb, 68.40; 2000-9900 lb,
65.30; 10,000 lb or more, 65.20.
Zinc Chloride (Anhydrous): 25 lb, 156.20;
50 lb, 151.40; 400 lb, 148.90; 800-19,900 lb,
140.00; 20,000 lb or more, 102.00.
Zinc Sulphate: Less than 50 lb, 141.30;
50 lb, 111.30; 100-1900 lb, 109.30; 2000 lb or
more, 107.30.
Copper Cyanide: 100-200 lb, 59.00; 300-900 lb,
57.00.

(Concluded from Page 117)

rests on export demand. Shipments
to Japan have been averaging two
boatloads a month, and if this vol-
ume is increased a price increase
is likely.

Seattle—Dealers are awaiting the
purchase by Japan of 1.5 million
tons of scrap, much of which is
expected to originate on the West
Coast. Yard activity is limited.

Los Angeles—Sales are down 25
per cent from volume at this time a
year ago. Mill inventories are in
good shape. Bethlehem Pacific
Coast Steel Corp. is the only mill
buying sizable tonnage. The price
outlook continues uncertain.

Steel Export Price Cuts Reflect Freight Change

New export base prices reflecting
recent reductions in export carload
rail transportation rates applicable
to North Atlantic seaports were ef-
fected by the United States Steel
Export Co., New York.

Reductions average about \$1.20 a
ton, except tin mill products are
off \$2.40 a ton. No changes were
made in semifinished products and
rails.

REVISED EXPORT STEEL PRICES

CARBON STEELS	Per 100 Lb
Joint bars	\$7.43
Tie plates	7.06
HR Bars (merchant quality)	6.09
HR Bars (special quality)	6.44
Standard shapes	5.98
C.B. Sections and bearing piles	5.98
Plates	5.75
Floor plates	6.83
Sheet piling	6.95
Reinforcing bars	5.76
CF Bars	8.10
HR Sheets (18 gage and heavier)	5.18
CR Sheets	6.36
Galvanized sheets	6.96
HR Strip	5.35
Vitrename sheets (12 gage)	7.23
Electrical sheets HR (electrical grade)	
Cut lengths (22 gage)	12.85
Long terme sheets	7.74
CR Strip (0.25 carbon and under)	7.51
Tight cooperage hoop	6.02

WIRE PRODUCTS

Bright nail wire	8.18
Black annealed wire	9.03
Galvanized plain wire	9.73
Barbed wire:	
Lyman 4 pt 5 in. (per 80 rod spool)	\$8.80
Glidden 4 pt 3 in. or 6 in. (per 100 lb)	10.13
Iowa 4 pt 3 in. or 6 in. (per 100 lb)	10.13
Waukegan 4 pt 3 in. or 6 in. (per 100 lb)	10.23
Nails (bright) (per 100 lb)	9.13
Staples (galvanized) (per 100 lb)	9.28

TIN MILL PRODUCTS

107# basis weight—14 in. x 20 in. 112 sheets (multiple package, metal containers)	Base Box
Common coke tin plate (1.25 lb coat- ing)	\$10.87
Electrolytic tin plate (0.25 lb coating)	9.52
Terne plate (manufacturing)	10.57
Black plate	8.62

TUBULAR PRODUCTS

American Standard Pipe (T & C random lengths)	Discount
Butt-weld, black	
2½ in. and 3 in.	minus 10.95
3½ in. and 4 in.	plus 0.45
Butt-weld, gal. 2½ and 3 in.	plus 5.30
Butt-weld, gal. 3½ and 4 in.	plus 16.30
Seamless, black, 2 in.	plus 16.75
Seamless, black, 2½ in.	plus 10.25
Seamless, black, 3 in.	plus 7.75
Seamless, black, 3½ and 4 in.	plus 6.25
Seamless, black, 5 in.	plus 4.80
Seamless, black, 6 in.	plus 2.30
Seamless, galvanized, 2 in.	plus 31.75
Seamless, galvanized, 2½ in.	plus 27.00
Seamless, galvanized, 3 in.	plus 24.50
Seamless, galvanized, 3½ and 4 in.	plus 23.00
Seamless, galvanized, 5 in.	plus 21.55
Seamless, galvanized, 6 in.	plus 19.05

ALLOY STEELS

HR Bars	\$6.91
HR Bar shapes	7.25
Plates	7.95
Standard shapes	7.25
HR Strip	8.85
CF Bars	9.21

HIGH-STRENGTH STEELS

COR-TEN		PER 100 LB
Cor-Ten:		
Plates		\$8.40
Standard shapes		8.50
CB Sections		8.50
HR Sheets		7.71
CR Sheets		9.40
HR Bars and bar shapes		8.48
Galvanized sheets		10.21
HR Strip		7.80
MAN-TEN "R":		
Plates		7.05
CB Sections		7.20
Standard shapes		7.20
HR Bars and bar shapes		7.11
HR Sheets		6.73
HR Strip		6.74

STAMPING PLANT WANTED

With heavy tonnage — large bed
presses. Send full particulars Box
737, STEEL, Penton Bldg., Cleve-
land 13, Ohio.

CLEANING EQUIPMENT

For plant maintenance and tank cleaning,
hot "jet stream" cleaning, with Sellers
Hydraulic Jets. Send for bulletin 424-B.

SELLERS INJECTOR CORP.
1603-Y Hamilton St. Philadelphia 30, Pa.

METALLURGISTS

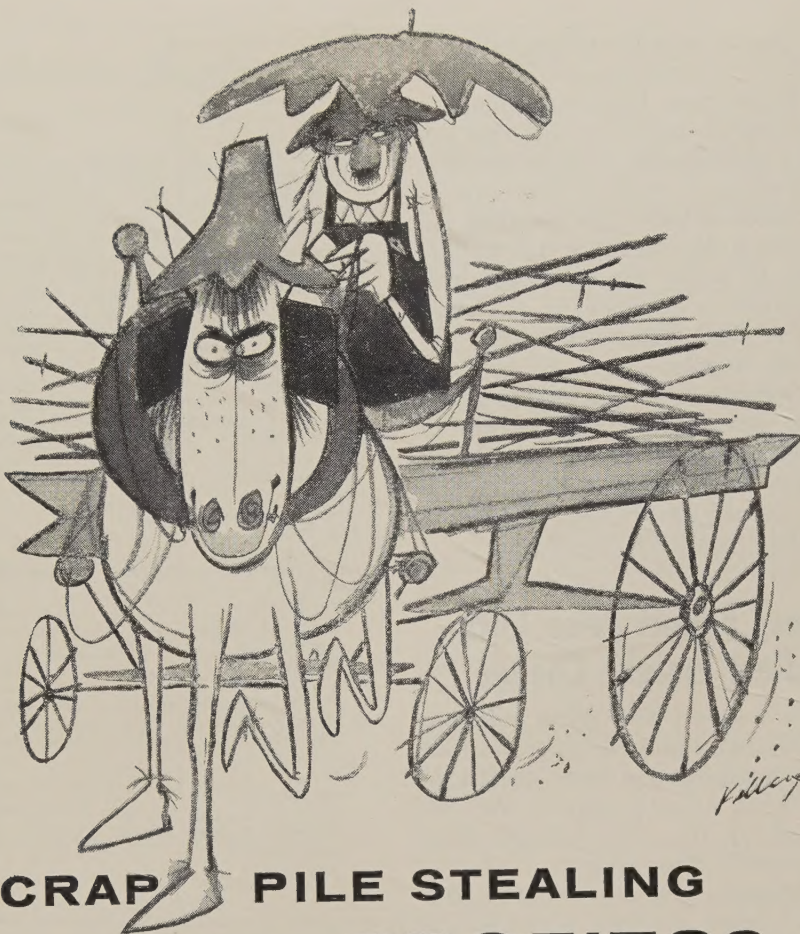

Large Metal Fabricating manufac-
turer in Western New York area
has immediate openings for gradu-
ate metallurgists with a minimum
10 years experience in hot metal
forming industries. Current re-
quirements are for Sales; Produc-
tion Metallurgy; Research and
Development. Send detailed resume
indicating past earnings and salary
desired. All replies confidential.

Write Box 736, STEEL
Penton Bldg. Cleveland 13, Ohio

CLASSIFIED

ACCOUNT WANTED

Have represented two concerns, fastener and
perishable tool manufacturers, in North and
Western Ohio for past ten years. Call on whole-
sale hardware, jobbers and industrials. Could
devote considerable time to additional non-
conflicting line in whole or part of mentioned
area. Reply Box 738, STEEL, Penton Bldg.,
Cleveland 13, Ohio.

SCRAP PILE STEALING YOUR PROFITS?

It can, you know. For every last piece of it represents money — money that belongs in your profit pile, not your scrap pile.

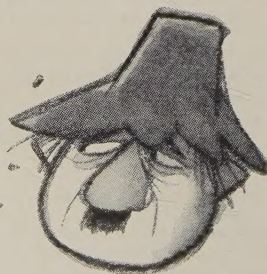

How do you evict this larcenous lodger? It starts disappearing as soon as you call Wheelock, Lovejoy — your local steel service center. W-L offers an extensive variety of special alloy steels — and you get them *cut-to-size*. By ordering your steel as you need it, you can practically eliminate waste. And you save important floor space by reducing your inventory.

Complete W-L facilities — including expert metallurgical service — are at your disposal *now*. See listing below for the W-L Branch nearest you. For complete technical information on grades, applications, heat treating, etc., write today for your **FREE COPY** of the Wheelock, Lovejoy Data Book.

Structural Shapes . . .

Structural Shape Prices, Page 106

Structural steel bookings amounted to 235,784 tons in January, up 20 per cent from the preceding month's total, and 45 per cent above the 162,158 tons booked in January, 1958, reports the American Institute of Steel Construction.

January shipments totaled 224,260 tons, a drop of 42,000 from the previous month, and 92,482 tons from January, 1958.

Backlogs of 1,794,430 tons as of Jan. 31, were down for the sixth straight month. Over 60 per cent of the total, or 1,107,282 tons, were scheduled for fabrication during the four months ending May 31.

Demand for structurals is picking up seasonally. However, there also is concern among builders about the availability of supplies this summer, in event of a steel strike.

STRUCTURAL SHAPES . . .

STRUCTURAL STEEL PLACED

13,000 tons, 41-story office building, Galbreath Ruffin Realty Co., Third Avenue, between E. 40th and E. 41st Streets, New York, through Turner Construction Co., New York, to Bethlehem Steel Co., Bethlehem, Pa.

2770 tons, Columbia Law School, New York, to Schacht Steel Construction Inc., New York.

240 tons, rebuilding transmission towers, Norwalk, Conn., Connecticut Power & Light Co., to Bethlehem Steel Co., Bethlehem, Pa.

200 tons, Boeing Airplane wing construction facility, Seattle, to Bethlehem Pacific Coast Steel Corp., Seattle; general contract to H. S. Ferguson Co., Seattle, low at \$256,200.

190 tons, regional vocational school, Hartford, Conn., to Standard Structural Steel Co., Hartford; Wexler Construction Co., Newton Highlands, Mass., general contractor.

115 tons, Oregon Pulp & Paper Co., office, Portland, Oreg., to A. Young & Co. Iron Works, Portland, Oreg.

STRUCTURAL STEEL PENDING

45,000-50,000 tons, 55-story Grand Central City office building, New York; bids to be asked in a few months; structure to be built by Diesel Construction Co. from plans by Emery Roth & Sons, New York; James Ruderman, New York, is consulting engineer on steel construction.

3205 tons, Clear, Alaska, missile detection base; Isaacson Iron Works, Seattle, is low bidder at \$721,856 to the U. S. Engineer, Seattle.

1710 tons, state bridge, Messalonskee stream, Waterville, Maine; bids March 25, to Augusta, Maine.

1150 tons, Idaho State underpass, Pocatello, Idaho; bids in; Pickett & Nelson low bidder.

1000 tons, also reinforcing bars; unit No. 2, Queensborough Bridge, Fraser River, near New Westminster, B. C.; John Laing & Son (Canada) Ltd., Vancouver, B. C., is low bidder at \$2,245,464.

850 tons, Esso Standard lube oil improvement building, Bayway, N. J., Sumner-Sollitt Co., 307 N. Michigan Blvd., Chicago, engineer and general contractor.

700 tons, fiber drum plant, Continental Can Co., Carteret, N. J., Walter Kidde Constructors Inc., 140 Cedar St., New York, engineer and general contractor.

600 tons, Public School No. 100, Bronx, N. Y.; bids March 12.

250 tons, Public School No. 141, Queens, N. Y., Planet Construction Corp., 11 W. 42nd St., New York, low on the general contract.
